28699. Re: [FT897] power out

Yahoo group: FT897 (2010)
Date: 2010-01-01 01:31:47 UTC
From: Dave Nelson
Topic: 28699 Message: 28699

Gordon,
well in FM or CW and into a dummyload wattmeter you should get pretty close to 100W on HF or 6M my unit does (97 - 100W).

If you look back through recent postings over the last month or so there are plenty of comments on what you power meter will read with a SSB transmission and normal speech level I wont repeat them here.

As far as SWR Vs power out .... the power out doesnt change (except until the SWR gets too hi and the protection circuitry cuts in and reduces output to protect the finals) but prior to that point an increasing SWR will just mean
that more of the output is reflected back towards the transmitter rather than being radiated by the antenna.

Have a look at http://www.antennex.com/preview/vswr.htm

and http://highfields-arc.6te.net/beginner/swr.htm#what

remember that 3:1 is ~ 25% of power reflected (lost)

and my fav comments from the bottom of that last link .....

Quote .... Why don't I just use an ATU?

response..... Quote...In simple terms an ATU tunes capacitance and inductance so that the standing waves are, in effect, canceled out. An ATU does not improve
the performance of a mis-matched antenna, it only 'fools' the radio (or amplifier) into thinking a good match has been achieved. Remember, an SWR reading of 3:1 at the antenna is still 25% of your output power 'wasted' even
if an ATU shows the radio a 1:1 (perfect) match.

Personally I dont like antenna tuners for that reason !! They are sort of a necessary evil to get a system working but are still an inefficient way of doing
things.

Nothing beats an antenna cut for the freq required !! it will resonate and radiate
with the best efficiency possible.

4. How much power should my 897D put out?
Posted by: "willgord" willgord@... willgord

Date: Wed Dec 30, 2009 4:52 pm ((PST))
I realize my rig will never put out the full listed 100 watts. but what would be a "normal" level of power given an SWR just a tad over 1.5. I am running barefoot, no amp. I am limited by having a screwdriver antenna inside my apartment with a counterpoise, cut quarter-wave for 20m hanging out the window.
Thanks and Happy New Year to all.

From: cooneye2002
Topic: 28700 Message: 28700

I am new to PSK31 and would like to give it a shot. I have a Yaesu 897d and use a laptop with HDR. I have seen a couple of guys on ebay who offer a data cable for PSK31 operation. If I understand correctly, I plug cable into radio and the other 2 leads into the audio jacks on the front of my laptop. Together with the software and proper programing of radio, I should be set to go......right?
Thanks in advance for your help and advise.

Gordon,
I am a new owner of an FT897D, so I am likely not the best person to answer this, but in the limited time I have had mine, I have noticed on my wattmeter that the peaks on CW are approximately 100 watts. I am running a tuner to an attic mounted dipole antenna. Of course on SSB, it's approximately half that with peaks in the 50 watt range or a bit more on voice peaks. I am not sure if your antenna will have much effect on the output power, but I think it should be about the rated 100 watts as long as you have the power setting at 100.

More or less that is what I use. I made my own cable because I am cheap
like that. The data port is a ps/2 keyboard/mouse connector. In order
to ensure that you have all 8 wires its better to get a keyboard/mouse
extension cable and not just a keyboard or just mouse. If you cut that
you have what plugs into the data jack, then with 3 very common
components you can make the cable trivially.
http://www.0xdecafbad.com/?p=144 has plans to do it.

Now there are some devices that use optoisolators which can limit noise
and prevent high levels of power going into your system, this would be
on the serial port connection, and I have not noticed noise there, nor
have I had high voltage go back into a serial port. I have had noise
from on the ground pin of the sound card though, usually when my laptop
is plugged into wall power, but that is something that can be dealt
with :)

I am also ready to give PSK31 a shot. After discussing best hardware interface, I decided to buy a SignaLINK USB device which has its own internal soundcard what looks like being the preferred option by quite a number of people (judging from response received from this forum).
BTW, for a PSK31 starter, I found this video very informative

From: jcglt
Topic: 28700 Message: 28704

I use my FT897D with a SignaLink USB on digital modes (mainly PSK31, PSKMAIL and WINMOR) and I am very satisfied. The SignaLink is cheap (around $100) and easy to set up (one USB cable to the computer, one specific cable provided by the builder to the transceiver and a few jumpers to set inside the box). It works very well with great stability, nice and clean signals.

28705. MFJ-993B & HRD

Yahoo group: FT897 (2010)
Date: 2010-01-01 09:59:48 UTC
From: Risk
Topic: 28705 Message: 28705

Hi guys,

After some pain staking fault finding with the MFJ-949E. I discovered the issue with the Tuner. Which a couple of people here managed to help me out with. Also I located the source of the beeping I had, which is also attributable to the MFJ-949E.

Okay so I am about to return the 949 to the shop where I got it. The owner has agreed to take it, and let me upgrade if I want as he has no others in stock.

Fair enough. Now having a Signalink USB and a Cat Cable to the Computer so I can operate the radio via HRD, I am now wondering what to do if I get an MFJ-993B and its associated Yaesu Cable.

Is there some way I am going to be able to still utilise the radio, the tuner, and the computer all at once, or am I going to need to get some kind of interface and keeping in mind picking up a linear is not too far away either, so I am going to need to take careful consideration of this upgrade if I choose to do it.

Cheers and I hope you have all had a good New Years turnover.

I use Microham's USB Interface III (nr 3). Expensive but well built, isolated and just working straight out of the box.

It has a built in soundcard. This is important as it leaves your standard soundcard (in your laptop) alone. Also I assume that the built in soundcard is optimized for DIG ham signals.

It has a good USB connection. No serial port to USB type of cables necessary.

Software is okay. Working with HRD and the interface is a snap! The maker of HRD recommended it when I asked about it on the HRD forum.

28707. Diving into PSK

Yahoo group: FT897 (2010)
Date: 2010-01-01 14:07:49 UTC
From: willgord
Topic: 28707 Message: 28707

I am usually the one asking questions in this group so it gives me pleasure to be able to offer some advice.

I have been active in PSK31 for about two months and enjoy it immensely.
Am working toward WAS and I landed Montana via PSK after having been unable to connect via phone.

I use Digipan as my software (free download) and SignaLink USB as my sound card. SignaLink was recommended highly before I took the plunge. The book "Nifty E-Z Guide to PSK31 Operations" (available thorugh ARRL) had nothing but good things to say about SignaLink. I ordered it directly from the manufacturer and have not ahd a moment's regret.

The unit is compact and looks extremely well made. It came with the cables necessary to connect to the 897D and to my HP laptop computer. Total price for the whole package, including cables, was $100.

Installation requires you to fix five wire jumpers in place. It is best to use small needle-nose pliers. Attaching the five jumpers took about five minutes. After that, it is a matter of programming the unit. I have Windows Vista and that requires some special programming, but all is explained in the manual.

I set the power for the 897 at 15 watts and use the knobs on the SignaLink to regulate the output. The aim is to keep power just below the level where the ALC kicks in.

Have worked 15 countries and as many states--all at 15 or 20 watts. One thing about PSK31 is that it seems to attract older hams. One reason is that older ears have trouble picking voices out of the noise. Another is that the typing that is central to PSK helps keep older fingers nimble.

To sum up, more than satisfied with SignaLink--the product and the customer service.

Hi Joe,

Being rather new to radio again, (initially got my novice ticket in like 82), just got back into the hobby. (btw, 16-Dec-09)

PSK31 is super exciting for me and the cable is easy to build. So this is a super simple easy little project.

I used a new PS2 keyboard extension cable from Office Depot. Make sure you put at least a 20dB pad on the audio out from pin 5 to ground pin 2. This will go into your mic input. Otherwise the audio out (Data Out 1200) is at 100mv peak.

I built mine with a little break out case with a project board from Radio Shack. I will be attempting some other additional items with it later.

Here is the link that inspired me to build it myself...
http://www.w3yy.com/FT897D-PSK.htm

Then I set the digital vox to 35, (Menu Item 40, page 58 of the 897D manual). At which point I fired up FLdigi running native on Macbook OS X 10.6

Tuned in to 20m 14.070 (always someone on PSK31 there) just to verify I was receiving fine, and it was. Then went up back up to 10m 28.120 for send testing... works like a charm. Now if 10m would just open up.

Can't wait to get my General ticket now to work PSK31 on 20m and lower... going to take the test on 9-Jan.

And as of last night I have FLdigi reporting via http://pskreporter.info/

I really like this mode.

Date: 2010-01-01 00:28:08 UTC
From: Blaine
Topic: 28646 Message: 28709

Thanks for all of the responses to my questions! I located information on the Yaesu FNB-78 battery packs, and found they are charged at 1.4 amps. So here is what I ended up ordering to solar charge my radio and the A123 auxiliary batteries:

(2) GSE Global P3-30W flex panels from affordable-solar, $439 ea
http://www.affordable-solar.com/GSE.P330W.12V.Flex.PV.Panel.Black.htm

(2) A123 4S2P Battery Pack from Buddipole, $165 ea
http://www.buddipole.com/4sa1bapa1.html

P3-30 Specs:
Nominal rated voltage: 18.8V
System voltage: 12V
Nominal rated current: 1.5A
Weight: 33 ounces
Dimensions, folded: 10.5 x 8.5 x 1.2
Dimensions, unfolded: 44.5 x 21.5 x 0.1
Warranty: 1 year
Built to MIL-SPEC 810 standards

4S2P Specs:
The 4S2P battery pack has a nominal voltage of 13.2 volts and a total capacity of 4.6 Ah. All Buddipole battery packs come with an internal self-resetting polyswitch (to prevent short-circuits) and installed Anderson Powerpole connectors. A double layer of heavy-duty heatshrink is applied to provide maximum protection for outdoor use.

Nominal Voltage
13.2 V
Capacity
4.6 Ah
Size
4.3" (110 mm) x 2.25" (57 mm) x 3" (77 mm)
Pack Weight
26 oz (737 grams)

28710. PSK and rf-output

Yahoo group: FT897 (2010)
Date: 2010-01-01 10:50:57 UTC
From: cergender
Topic: 28710 Message: 28710

Happy New Year to all!

When using SignaLink USB to transmit PSK modes, the instruction tells to use the full radio rf-power which
you can reduce to recommended 20 - 30 watts via pc sound volume controls or SL TX-control.

What is happening? Is the radio output itself really
going down then or is the radio itself struggling still with the full power which is only suppressed by SL?
And the radio going screaming hot?

If the radio is running all the transmitting time with full power, that cannot be very healthy on the long run.

Who can tell how it is.

Ben

28711. What can I do with an 80 foot TV tower?

Yahoo group: FT897 (2010)
Date: 2010-01-01 14:15:43 UTC
From: Blaine
Topic: 28711 Message: 28711

Happy New Year everyone!

I'm new at this, so I have lots of questions. Years ago my dad built a guyed 80-foot steel pipe "tower" for our television antenna on the ranch. I think he found the plans in Popular Mechanics, and the tower is balanced and pivots about 20 feet up so that you can bring the top to ground level to work on the antenna (but it's kind of a scary process). Interestingly enough, we discovered years later you could get the same television stations leaning an antenna against the barbed wire fence next to the tower.

My question is this: Can I use this tower as an antenna or antenna base for my FT-897D? It's about 100 yards from the ranch house where the radio will be located. Guy wires (total of four, two heights, opposing) are galvanized steel coming off the tower at about 45 degree angles, and connected with turnbuckles to steel rods buried in the ground with concrete around them.

If this is just a pipe dream, let me know. But if this thing is actually useful, I'd really like to hear your ideas about making the most of this point on the aeronautical maps. Detailed descriptions of how I might use it and the materials I'd need would be really helpful.

And if I can use the barbed wire fence, I'd like to get your feedback on that too. Lord knows, there are a lot of them around here!
-Blaine

I'm not about to kick around new battery technology, and the Li/ion batteries are really good.

but keep a few things in mind.

one, they normally require a specialized charger to keep them from going up in flames.

If you fly or know anyone that flies r/c planes, you can't take the batteries into a indoor arena unless they are in a flameproof container.

the cells need to be balanced with a special circuit.

Most solar charge controller won't work with this chemistry

and $165 for a 4.5 amp/hr battery is a bit too rich for my blood.

A 7.5 amp/hr lead acid is about $20 new, can be charged by just about any solar charger controller out there.

Other than the fact they pack a lot of bang into a small size, and if that size/weight is a primary concern, I'd save $140 and get a different battery.

Everyone have great new year!

28713. PLL unit repair experience?

Yahoo group: FT897 (2010)
Date: 2010-01-01 19:29:33 UTC
From: Geert Jan de Groot
Topic: 28713 Message: 28713

I wonder if others can share their experience repairing the PLL unit of
the 897?

I bought a known-broken 897, and have repaired a few problems, but I'm
a bit stuck with the PLL board. The display flashes and UL is low,
indicating an unlock condition.

The PLL unit exists of an AD9850 DDS, which feeds (according to the docs),
7.2 - 8 Mhz reference signal to the FQ7925 (old radios, like mine),
or ADF4116 PLL which locks the 5 VCO's in the PLL module.
I checked TP2003 (22.625 MHz reference signal, OK), and TP2001 (DDS out - no
signal whatsoever). Hence, the PLL chip doesn't get a reference signal
and this clearly explains the unlock condition.

The AD9850 gets clock, I see control data being clocked in
(FD, FCLK, FSTB) and power voltages are OK but there is no output
on the DDS - neither on TP2003, nor on pin 20, the complement output.

QUESTION: does anybody know how to debug an AD9850 DDS? If it gets power,
clock, and programming, shouldn't it do *something*?

Now, for the bad news: the PLL module is double-sided and the components
of interest are on the bottom. This means you need to un-solder J2001
and J2002 which took me the better part of an evening.
Be very careful not to destroy the vias - the PLL board is a multilayer,
there are unsoldered tabs from the metal screening under the board
(keeping the height of the board up) and of course the PLL board
is soldered to the metal box.
Only recourse is to unsolder the PCB from the metal box, unsoldering
J2001/J2002 and carefully lifting it. This is very difficult.

It's not easy to obtain the DDS chip - even Farnell doesn't have it
on stock and the minimal order and lead time are excessive.

The other (sideband) DDS is working fine.

Oh, has anybody figured out the frequency plan of the whole PLL module?
22.625 reference clock into the DDS, 7.2-8 MHz reference to the main PLL,
and is the main PLL just a multiplicator / filter?

73,

Geert Jan PE1HZG

Well, there are plenty of broadcast antennas that use a vertical mast, which sits on top of an insulator at ground level.

Sounds like it would support a 2-meter or even a 6-meter (small) yagi. Or you could hang a windom or other doublet antenna with the mast as the center point.

I wouldn't even consider any kind of HF beam (LOL).

Topic: 28711 Message: 28716

Offhand, I'd say you are very lucky to have a tower like that. The one problem I see is that it is so far from your house. 100 yards is a long run for coax--even the really good stuff. However, there are various ways to make it work. As an end support for a wire it would be good too. If you invest in some really good (low loss) coax, you can probably do fairly well with that tower as a center support. I suppose you could use balanced line and really minimize the losses. Anyway, I'm sure you will find a good way to use it.

Hello Blaine, and a Happy New Year to all.

As mentioned in previous post, you cannot use the
mast itself, as an antenna, without an insulator at the base !

You can certainly use the mast to support the top end of a *sloper* wire antenna.

There are lots of examples of *long wire* slopers, even ones with *traps* for the various bands,,, fed from your shack, at the low end, and with an insulator at top and ground side, you can feed this with a short run of co-ax from the shack to the base of your *sloper*

If you ant to attach any beam to the top of the tower, you will need a rotator, at the top, and a long length of control cable, as well as the RF feeder.

As said before you will have massive losses with co-ax so twin feeder would be less loss, but to take it to the top of the tower at that distance, would require a non metallic guy rope to support the feeder at the diagonal,,, this will be a minimum of 330 feet. or along the ground and up th mast, would be just less than 400 feet. Not forgetting that if using twin feeder you would need to stand it off from the metal mast.

Look for examples of *sloper* antenna, in the ARRL Antenna book, or google * multiband sloper antenna* and see if anything might suit your location.

I also have access to a large tower - 100 foot /30 metres - standing on the farm of my son-in-law. It was home to a TV antenna (before the arrival of the satellite dish) and two-way radio antennas.

I have a long wire set up at about 15 metres and it works well. Made use of a catapult to get the rope up to pull up the antenna.

One problem I have is fear of heights - maybe I should try climbing at night! And of course the Spiderman suit has shrunk - must be the washing powder.

Greetings

Dennis, ZS4BS

Hi Peter,

Not strictly true. You can use it even if it is grounded at the base, so long as you have insulators in the guys. Just run your coax to the base and connect its shield to the base and then tap the centre conductor up the mast until you find a position which gives you a low SWR.

You would be amazed what you can make work with a bit of ingenuity! Just do some experimenting. It's fun.

the tower is a real plus for you.. get something like a buxcom sloper folder diploe.. mount it close to the house and use dacron rope to attach it to the tower.. that way you can make a short run of good coax. buxcom has good info on how to do this.. its a no brainer and you get a cheap ALL hf band antenna with no tuner required. you can also use the tower for a nice uhf/vhf beam.. i would think long and hard before climbing it. my elmer had a tower fall with him on it.. dead is dead..

Hello Eric,

I am aware of tuning the mast using a gamma arrangement,,, but as our friend is new to antennas, I was looking mainly for the obstacles,,, the tower is 100 yards from his QTH.

I am recommending an inverted "I" antenna, fed at the shack end of the vertical, with a good ground system, and sloping up to the top of his mast. That worked well for me when I borrowed a fixing point on a nearby water tower,,, first inspection team cut the top of the wire which was put up at night, and was invisible in daylight. It was incredible for top band for a couple of weeks in 2002.

He could also try a delta loop fed on the lowest side,,, all that is needed is browsing for antenna designs,,, plenty of electrical wire, and ,,,, experiment !

Cheers _____ Peter EI4HX ei4hxperimental@...

Topic: 28723 Message: 28723

Operating manual says:

QUOTE
PMS setup is simple to accomplish: 1. Store the upper and lower limits of desired range into the PMS memory pair ("M-PxL" and :M-PxU")
2. Switch to the Memory mode by pressing the V/M Key once then rotate the Dial to select the Memory channel "M-PxL" or "M-PxU"
UNQUOTE

Where can I find "M-PxL" or "MPxU"? When I execute instruction 2 (see above), rotating the dial makes the frequency changing rather than giving he choice to select memory channel.

I have only been using PSK31 for a couple of months and the only interface I am familiar with is SignaLink USB. So far, it has done everything I wanted it to. Can't say which interface is the most robust or which provides the most bang for the buck. But I have yet to see any reason to require anything beyond SignaLink.

I made my choice based on the recommendation of N6FN, in his book "Nifty E-Z Guide to PSK31 Operation." Heard good things about the book and bought it through ARRL. He raved about the SignaLink USB and so I bought it.

The rig looks good--well-made and solid. Set-up is easy. Open the case with the provided hex wrench, set five jumper wires, and you are in business. Cost is $100 with the appropriate cables for the 897D. I had a few technical issues and called SignaLink tech support. You pay for the call but the support is free.

I guess every interface has its own group of fans. But I have had no reeason to rethink my choice of SignaLink.

Make sure when you press the V/M button, you have gone into the memory channel mode by observing the upper left, you should see something like M-001 or some other number. Rotate the MEM/VFO CH knob and the memory channels should change, and eventually you should come to M-P1L then M-P1U then M-P2L and finally M-P2U.

On my radio they are memory bank 'k' (my radio memory is devided into
banks) and they look like:

Mk (dot or dash) 1L USB

Mk (dot or dash) 1U USB

With the BIG text reading 6 Meter

Dot or dash being if it's being skipped or not. You can only have one pair
selected I presume it would be in the same band but that assumption is
untested by me.

With my programmers software, they are a tab, along the bottom.

Hi,

I am having a problem changing Menu #20 on my FT 897.

It seems that I cannot exit the Tuner mode, I want to change over to the CAT mode.

I select Menu #20 and then turn the VFO dial but the no change.

Maybe I am missing something, or just been to long since I did this last.

Can anyone help out, what I am missing here?

From: Wolfgang Wittmann
Topic: 28723 Message: 28732

Thanks for replies! I had not properly executed instruction no. 1 (Store...). I noticed now that those frequencies need to be stored following the usual way of pressing "MW" in Multi Function Row "MFb".

I finally succeeded to store lower and upper frequencies for scanning the follwoing way:

1. Tune to desired "lower limit" frequency using the MAIN DIAL
2. Press F key momentarily then rotate MEM/VFO CH knob until Multi Function Row "b" [MW,SKIP,TAG] appears on display
3. Press [A] (MW) key
4. Rotate the MEM/VFO CH knob as needed until "M-P1L" appears on upper left corner of dispaly.
5. Press [A] (MW) key

Repeat same for "upper limit" frequency and store it under "M-P1U"

Save further frequency ranges the same way unter "M-P2L" and "M-P2U" etc.

Please note, if "ON" is seleted under Menu Mode No.55 [MEM GROUP], memory channels will not be called M-P1L, M-P1U....but Mk-1L, Mk-1U...

73
Wolfgang VK2-LKW

Make sure when you press the V/M button, you have gone into the memory channel mode by observing the upper left, you should see something like M-001 or some other number. Rotate the MEM/VFO CH knob and the memory channels should change, and eventually you should come to M-P1L then M-P1U then M-P2L and finally M-P2U.

Hi Blaine
As some others have said, you are very lucky to have a ready built mast, admittedly some way from your shack.
As a topbander and someone that has played around with long wires, I'd put up a topband fullwave end fed. Straight from your shack to the top of the tower and down the other side.
You'd need some fairly strong wire to keep it tight to the mast, but here in the UK, the surplus stores sell something called DOM10, a plastic covered stranded wire; a military wire that is very strong. Comes on drums half a mile long and sells for about 50 UKP! The military use it for everything; from antennas, washing lines and pulling landrovers out of ditches! Worth a try.

Regards
Jerry

Peter I would disagree with the comment "you cannot use the mast itself, as an antenna, without an insulator at the base!". You can shunt feed the mast without it being insulated from the ground. I have a friend with a 125' non insulated tower that is shunt fed and he uses it for 160M with no problems.

And If you are running on HF you will not have enough loss to worry about for the distance to tower. The feed point of my dipoles are over 150' from my house and they work great. I am feeding them with RG-11 and loss is minimal on HF.

Just throwing in my 2 cents here.

Hi Ric,

I use the Buxcomm Rascal, it's cheap and works very well, it also comes with a choice of radio to interface cable I have 2 Rascals, one of which has been in use for contests, field days, demonstrations and daly use for 4 years and it still works perfectly.

Cheers,
Mike G8XDX

Apologies for rehashing an old subject here, but I am confused. My radio came with only jumpers 1 and 2 enabled (not 6). I removed 1 and 2 and enabled 7,8,9, 6 in the proper order. Factory reset and nothing changed.

What am I missing here??

Is your radio an FT-897, FT-897D, or European? Different jumper settings...make sure you are opening the right jumpers for your radio.

Count me in the MicroHam USBIII camp!

Depends on what you're looking for, and are willing to spend. I ran a homebrew setup with 1:1 transformers into the laptop, then I ran a Signalink, and now I have the USBIII.

I use the USBIII for Digital modes, but also Remote Base and as a Sysop "Link" station on Echolink (with minor cabling mods). It does it all, and does it well. Audio quality In and Out is very clean. The Signalink was good, but the USBIII beats it no contest. Better RF filtering/shielding for clean RX/TX audio for remote base, better built, more features.

If you can afford to spend a bit and want more versatility, USBIII is THE way to go. I was cheap for a long time, and sat on the fence for a while before buying even the Signalink. Most onboard computer soundcards are crap! LOL. At least get a Signalink :)

My 02 cents.

I had a similar problem - the VHF/UHF port became deaf. The shop said that they were going to send it to Yaesu UK for repair, but as it was only three months old from new and it had had related problems during the three months (odd squelch, poor FM quality, lack of IF gain etc etc), I insisted on a replacement under the UK's Sales of Goods Act. They umm'd and arr'd but the shop did send me a replacement within a week. The new 897 is much livelier and exhibits none of the problems that the old one had.

I'm afraid that UK Ham shops seem to all have their own idea of the Sales of Goods Act, and once they have your money, that's it....

Hi Ed,

Ill be happy to, however, if you dont hear back from me in a couple weeks please send me a reminder to jog my memory. Is yours a D model? I have done a lot of research and have not found anyone complaining of the same problem. Mine was about 90% deaf on VHF possibly UHF but HF was fine, if my ProII coould hear it on HF then the 897 could albiet not as pleasantly. Is yours the same, meaning not totally deaf but close. I also asked them to properly realign the radio as i have heard many complaining that the factory initial alignments were horrible. Its too bad the warranty has expired.

Thanks,

Mike

28750. Data socket transmit, and PTT method weirdness?

Yahoo group: FT897 (2010)
Date: 2010-01-05 16:31:42 UTC
From: Damien Gardner Jnr
Topic: 28750 Message: 28750

Hey Folks,

So in getting my shack setup for PSK31, I finally got around to making a cable to go yaesu data port to two 3.5mm plugs to go into the soundcard on my laptop.. Since I'm running HRD with a USB->CAT adapter, I didn't bother with the serial->PTT circuit.
I then spent the next two days messing about trying to figure out why it wasn't working, until I struck on the fact that I *had* to select DIG for sideband use (and then select the U or L mode in the digital menu entry), and PKT for FM use, to have the audio at the data socket be transmitted. AND the mic had to be unplugged from the unit, or any noise coming in from the mic was also transmitted!

Bit weird, but ok, if that's what you have to do, i guess that's what you have to do..

I was just talking to a mate about doing a bulk order of OpenTrackers, as mine's just gone deaf on it's GPS port, and it occurred to me.. - When I plug my OT1x into the back of my 897, it 'just works'.. - aka I shove the radio into USB, tune it up to the appropriate freq (actually a little off the 30m APRS frequency, as the 300 baud programming in the OT1x never included the change in tones compared to 1200, so you have to off-tune to compensate..), and away it goes... (And for that matter, just shove it on FM on 2m, and away it goes)

So I'm wondering - is this a known difference between keying the transceiver up via CAT, and keying it up via the PTT pin on the data port? i.e. if you key up via CAT, you have to use PKT or DIG modes, and unplug your mic.. - but if you key up with the PTT pin on the data port, it just transmits whatever audio you are putting into the data port, in whatever mode is currently selected, and ignores the mic? Anyone else seen this? If so I guess I should take the extra effort and build the serial->ptt circuit? - but wanted to check before I went to the effort :)

Cheers,

DG

28752. Oldest FT897 on the site?

Yahoo group: FT897 (2010)
Date: 2010-01-05 19:11:01 UTC
From: prybry
Topic: 28752 Message: 28752

I just picked up a used FT897 from HRO... looks to be one of the first production units made since the serial number is 2H010120

I think that means that it was built in June of 2002... they didn't go on sale in the US until Sept. of 2002 and the first units shipped about January of 2003.

Anybody got one older than mine?
Just curious...

From: w4wb
Topic: 28752 Message: 28753

WOW! That is one of the oldest 897's in the world. Yes, the serial number indicates that it was built in June 2002 and is from Lot 01 and the 120th unit made. What is a bit odd is that normally the first lot is for Japan consumption and then the 2nd or 3rd show up in the USA. For example, the first lot of the FT-817s that came to the USA were Lot 03 and were made in August 2000. They arrived in the USA in November (there were 80 of them and I got one of them from HRO). I would suggest that you ask HRO if the updates to your radio were made, and if not I would send it to Yaesu for the updates.

Enjoy es 73 de Barry W4WB

> WOW! That is one of the oldest 897's in the world. Yes, the serial number indicates that it was built in June 2002 and is from Lot 01 and the 120th unit made. What is a bit odd is that normally the first lot is for Japan consumption and then the 2nd or 3rd show up in the USA. For example, the first lot of the FT-817s that came to the USA were Lot 03 and were made in August 2000. They arrived in the USA in November (there were 80 of them and I got one of them from HRO). I would suggest that you ask HRO if the updates to your radio were made, and if not I would send it to Yaesu for the updates.

Who would have guessed. Same luck as the lottery. Close but no winner.
My original 897 S/N is ....
2H010126, only 6 units away. They were probably on the bench together.
The band plan in it is U.S. I've been using it on all my trips to the
islands for all these years and it has been performing wonderfully. I
have an original AT897 and FC-30 PS with it. I also take my original
FT-817 as backup just in case.

From: wa3pak
Topic: 28758 Message: 28758

For those of you that have the FP-30 AC supply on your FT-897, does this supply increase the height/thickness of the rig? I am looking at some carry cases for mine and would like to add the FP-30, but wondered if it changed the height/thickness of the rig. The carry case I already have would be ideal, but it it's much higher/taller than the rig without one, it may not fit. Thanks in adavance for any insights you can share.

I have had my Tech license for almost 2 months now. I am trying to do PSK31 on my FT897. I am using a Signallink USB and the Yaesu CAT cable. I started with Digipan and am considering HRD. The radio keys but I see no waterfall and am unsure of how exactly to set up the radio.
Mode is packet.
VFOa mode not mem
Band is 145
Power 5W
radio defaults still in effect
any help would be appreciated

Brad-
I have my FT-897, with FP-30B power supply installed, sitting right in front of me. MEASUREMENT, with a ruler, shows the increased height to be EXACTLY 1/2 inch (one-half inch). No more, no less. The feet on the power supply don't count because they are exactly like the feet on the original "flat" bottom.
When turning the power on, first turn on the power supply then turn on the FT-897. When turning the power off, first turn off the FT-897 then turn off the power supply. I don't know why but Yaesu says to do it that way. Good Luck.

Sometimes free software is worth what you pay for it.A lot of people get started with Digipan (I did) but if it is ever set up wrong it remembers and you will never get it to work right on that computer. Do yourself a favor and move on to HDR or one of the other programs.

Yes, the height dim. increases slightly as compared to the bat. cover which is flush with the bottom of the radio. I don't have my radio with me but I think its around 1/2" or 5/8".

28766. Can't interface HRD!

Yahoo group: FT897 (2010)
Date: 2010-01-07 23:57:58 UTC
From: kb1syv
Topic: 28766 Message: 28766

Hello everyone,

Hi All,

I bought programming software from RT Systems and it came with a CT-62 cable with an USB end instead of a serial. I have an FT-897D and I connected it to my CAT out. I don't get any unknown driver error, everything loads normally. I'm using Vista on my laptop. When I bring up HRD 5.0 build 2321, I get this:

X Frequency =0
X Ft-897, COM 3, 38400, Failed to read frequency.
! Make sure your radio is not in memory mode
! If you are using a homebrew/non-standard cable, you may need to select RTS and/or DTR

I've tried all the above with different baud rates, auto detecting and such. RT Systems say's that it is a CT-62 cable, but with a USB instead of a serial end. Any suggestions would be helpful. Just a reminder, the USB was detected and drivers loaded without an issue.

I have a LDG AT-897 auto tuner and I'm using the CAT interface on the back of the tuner to connect my pc. I also noticed when I disconnect the autotuner and go to menu 20 to change value to CAT, it won't let me, it stays on tuner. Any help or suggestions would be really cool.

Thanks

73,

Jethro

I have exactly that setup - if you're using the AT897, it *should* be
set to CAT, not tuner.. And should be set to 9600 for baud rate, as
that's the rate the AT-897 uses to talk to the radio..?

Cheers,

Damien

From: Jon Perelstein
Topic: 28761 Message: 28771

You probably want to try (1) reading the instructions that came with the SignaLink, and (2) reading the instructions in the FT-897 manual. Since you say that you're using the Yaesu CAT cable, you clearly have not read the instructions that came with the SignaLink since the SignaLink specifically does NOT call for using the Yaesu's CAT cable. Since you have your radio set for packet, you clearly have not read the instructions in the FT-897 manual since for PSK it specifically calls for setting the radio to digital mode (DIG) and not packet mode.

1. You have to configure the SignaLink by setting the internal jumper wires. It means opening the case of the SignaLink (they give you a little Allen wrench for that and also give you a bunch of little wires). As they say in the SignaLink instructions, this needs to be done BEFORE connecting the SignaLink to your radio, or you may damage your radio.

2. The SignaLink attaches to the FT-897 through the cable supplied with the SignaLink. This cable has an RJ-45 connector on one end and a 6-pin, mini-DIN jack on the other end (I am assuming that you ordered the correct cable from SignaLink when you bought the SignaLink). The RJ-45 end of the cable is connected to the back of the SignaLink where it says "Radio" and the other end of the cable is connected to the DATA jack in the back of the FT-897 (NOTE: Not the CAT jack).

3. The SignaLink is attached to your computer through a USB port. That cable has a USB type B jack on one end (small and sort of squarish) and a USB type A jack on the other end (bigger but flatter). The B end connects into the SignaLink where it says "Computer" and the A end plugs into a USB port on your computer. Make sure that you have configured the SignaLink's jumpers BEFORE you connect up to the computer.

4. Unless you're running Windows 98, the SignaLink should be recognized by the computer and it should automatically install the driver software. If you're still running Windows 98, you should seriously be asking yourself if you're the kind of person who should be dealing with high tech objects like knives, forks, shoelaces, and indoor plumbing.

5. Configure Windows to play its "system" sounds through the computer's sound card (note: NOT the SignaLink). SignaLink gives good instructions on pg 3 of their user guide.

6. Configure your radio for the type of digital mode. As specified on page 37 of the FT-897 manual ("PSK Operation"), for PSK-31 you set the radio for digital (DIG). In addition, you set menu item 038 for PSK. Most people use PSK Upper Sideband (PSK-U), so try that setting.

7. Digipan is a perfectly wonderful piece of software that doesn't "remember" bad settings or anything ridiculous like that. Configuring it is

easy.

a. Set your personal data in Configure|Personal Data.

b. Set the Serial port to NONE (Configure|Serial Port)

c. Set the receive sound levels using the Waterfall control (Configure|Waterfall) in conjunction with the SignaLink's Transmit Volume control knob, and set the transmit sound level using the Transmitter control (Configure|Transmitter) in conjunction with the SignaLink's Receive Volume control knob. SignaLink gives a reasonably good explanation of how to find good sound levels. In general, you want to set the Transmitter sound level so that you are getting just a very little bit of ALC action (menu item 061 on the radio gives you access to monitor ALC when transmitting).

The final thing is that you need to find people who are doing PSK on the 2 meter band. In this area of the country, there's not a lot of PSK on 2 meters, but it may be different in your area. In addition, those people in this area of the country who are doing PSK on 2 meters seem to mostly use horizontal antennas rather than vertical antennas for their PSK operations, but again that may be different in your area. On 2 meters, the difference in polarization between a horizontal antenna and a vertical antenna is very noticeable and you literally might not hear a signal from a horizontal antenna if you're running a vertical antenna and vice versa.

I have a question I'm hoping someone can help me with.

I have an FT-897 (pre D) set up with an Elk 2M/440 Five Element connected to 144/430 socket and my LDG Z-11 tuner with 80m dipole connected to the HF socket. My 2m works great, but 70cm use on the 444 Mhz repeaters in the area triggers the HF tuner.

I don't see any settings to swap 70cm between sockets unless its there in the manual and I'm missing it. Am I getting RF into the tuner by some other path then?

this is a known issue with some tuners. Other tuners are capable of
filtering out any stray RF that goes over the HF plug when using UHF.
You can either install a pass filter or disconnect the HF when using UHF
(or in the case of my LDG tuner there is a setting to disable the
automatic tune on high swr which solves the problem).

Jon,

Thanks for taking the time to comment on my post.
I believe I have the Signalink working fine.. the transmit light comes on and it keys the radio. The Yaesu CAT cable is being used to control the radio via the software. I have both USB cables connected to my PC if this was unclear I apologize.

I missed the section in the FT-897 manual where it says to use dig for PSK thanks for referring me to it. I have another novice question: If you are just sending tones why implement a special " dig" mode wouldn't FM or packet work too especially on 2m.

In step c did you swap transmit and receive? If not that could be why my waterfall looks so bad/nonexistent. I only see something when I transmit.

"c. Set the receive sound levels using the Waterfall control
(Configure|Waterfall) in conjunction with the SignaLink's Transmit Volume
control knob, and set the transmit sound level using the Transmitter
control (Configure|Transmitter) in conjunction with the SignaLink's Receive
Volume control knob. SignaLink gives a reasonably good explanation of how

Topic: 28766 Message: 28776

Hello,

It seems like a large chunk of the issues posted to this forum center around problems trying to connect HRD to a radio using a USB cable (similar to this user's problem.)

I have a Yaesu FT-897D, running HRD and connected back to a PC using a USB style CAT connector. I originally spent several frustrating hours trying to get the PC to connect and talk to the FT-897D. I finally found what I think is the key. Once in a while I lose my connection (usually after Windows has downloaded a new update) and have to "fiddle" with things a bit, but I always have success now that I think I know what to look for. I hear a lot of folks talking about the drivers. I won't say that is no the problem, but I would suggest you follow these steps first:

1) First of all it needs to be noted that if you are using the FT-897D there are COM port settings in three places that you need to look at and they must all match.

2) Start by going into Device Manager, and then into Ports. First check to see which port is actually assigned to the USB adapter. (In my system, sometime it is COM4, and sometime it is COM5.) Next double click the specific port and check the other settings. I recommend that you set the port to 9600 Baud (I think that is the default.) Also check the other settings. In my system, I have 7 data bits, none for parity, 1 stop bit and none for Flow Control.

3) Next check the FT-897D settings. Go into Menu, item 019. Make sure the Baud Rate matches that in step 2 (again I recommend 9600.) While your there check Menu item 020 to makes sure it says CAT. (It won't work if it is on linear or tuner. HRD and the PC require the CAT setting.)

4) Now go to HRD. Make sure you are using the correct COM port and the correct BAUD rate. Flow Control should not be checked. In most cases it should now connect. If it does not, try to select auto detect only for baud rate (keep the COM port set to the correct number.) In my rig this step has always worked.

I hope this helps you. It has always worked for me.

I think someone should turn this into a Word document and upload it to the files section of this forum since it seems to be such a problem. Then we could just send folks to the files section.

Thanks and 73,
Mike, AE8U

Hallo Bill

Do you have already a answer. is it possible to use the ft897d with batteries on a external dc supply?

When you get that all sorted out. A good case is a pelican case. Look on line for a good deal on a case that will work. I have a 1450 case and it works well. Just the radio though. Tuner in another box. I looked in hindsight at a 1560 case and that is a better setup as you usually won't just carry the radio. Pull out handle and wheels. Carrying the 1450 without a shoulder strap is pretty much of a load. And it traveled without the balun, tuner, or welding wire and slingshot.

Hi. I have a slightly different problem with my 897D. HRD is hooked up and working fine, but I cannot get AC Log to connect. I've tried all different combos of settings as suggested by many, but still I cannot get it to interface with the radio. Any sugestions? Are you or any one out there able to operate both software together? I'd like to switch between the two at random.
Thanks in advance.

Hello,

It seems like a large chunk of the issues posted to this forum center around problems trying to connect HRD to a radio using a USB cable (similar to this user’s problem.)

I have a Yaesu FT-897D, running HRD and connected back to a PC using a USB style CAT connector. I originally spent several frustrating hours trying to get the PC to connect and talk to the FT-897D. I finally found what I think is the key. Once in a while I lose my connection (usually after Windows has downloaded a new update) and have to “fiddle” with things a bit, but I always have success now that I think I know what to look for. I hear a lot of folks talking about the drivers. I won’t say that is no the problem, but I would suggest you follow these steps first:

1) First of all it needs to be noted that if you are using the FT-897D there are COM port settings in three places that you need to look at and they must all match.

2) Start by going into Device Manager, and then into Ports. First check to see which port is actually assigned to the USB adapter. (In my system, sometime it is COM4, and sometime it is COM5.) Next double click the specific port and check the other settings. I recommend that you set the port to 9600 Baud (I think that is the default.) Also check the other settings. In my system, I have 7 data bits, none for parity, 1 stop bit and none for Flow Control.

3) Next check the FT-897D settings. Go into Menu, item 019. Make sure the Baud Rate matches that in step 2 (again I recommend 9600.) While your there check Menu item 020 to makes sure it says CAT. (It won’t work if it is on linear or tuner. HRD and the PC require the CAT setting.)

4) Now go to HRD. Make sure you are using the correct COM port and the correct BAUD rate. Flow Control should not be checked. In most cases it should now connect. If it does not, try to select auto detect only for baud rate (keep the COM port set to the correct number.)

In my rig this step has always worked.

I hope this helps you. It has always worked for me.

I think someone should turn this into a Word document and upload it to the files section of this forum since it seems to be such a problem. Then we could just send folks to the files section.

Thanks and 73,

Mike, AE8U

28783. Re:Ongoing Newbie Saga

Yahoo group: FT897 (2010)
Date: 2010-01-09 02:33:50 UTC
From: JonP
Topic: 28761 Message: 28783

>>The Yaesu CAT cable is being used to control the radio via the software. I have both USB cables connected to my PC if this was unclear I apologize.

The CAT cable is certainly not needed to make Digipan work with an FT-897 and a SignaLink. I'm not sure what impact the CAT cable would have on Digipan but I would remove it for debugging purposes.

>>If you are just sending tones why implement a special " dig" mode wouldn't FM or packet work too especially on 2m.

I would guess that the DIG mode is used to activate the data jack, but I don't know for sure. A signal fed through the microphone jack would work just as well, but the SignaLink with the 6-pin mini-DIN is intended to be plugged into the data jack. Other interfaces, such as the RIGblaster NOMIC are intended to go through the microphone connector and headphone connector.

I have not done any PSK on VHF. On HF, PSK is done through SSB (thus the PSK-L vs PSK-U setting). I don't know if it's the same on VHF, but if not there could be an issue since the radio is trying to do SSB in DIG mode. I have trouble envisioning PSK in FM because one of the key concepts of PSK is that it has a very very very narrow bandwidth, which it certainly wouldn't have with FM.

>>In step c did you swap transmit and receive? If not that could be why my waterfall looks so bad/nonexistent. I only see something when I transmit.

Oooops. Set the receive sound levels using the Digipan Waterfall control in conjunction with the SignaLink's Receive volume control knob, and set the transmit sound level using the Digipan Transmit control in conjunction with the SignaLink's Transmit volume control. Sorry about that.

*****

I know that a properly configured SignaLink works in DIG mode with an FT-897 on HF when the the digital mode is set to PSK-U because I have about 300 PSK contacts total across 80, 40, and 20 meters (including 38 states and 71 countries) using a SignaLink with my FT-897. I suggest you try listening on 40 meters at 7.035MHz, which is where the bulk of the 40 meter PSK activity happens (even though most of the "band plans" say it should be at 7.0695Mhz). At least around here, 40 meters PSK seems to be much more active at night than 20. You can also try 80 (3.580Mhz). Even if you only have a 2 meter vertical antenna, you should be able to hear at least some of the signals. Of course, if you have an HF antenna, all the better.

Make sure the Signalink is properly configured, make sure the computer is properly configured, and set the radio for DIG mode and PSK-U. Then play with the volume controls according to the SignaLink manual until you can hear something.

If you're able to see signals on the waterfall listening on 80 or 40, that will at least tell you that you have the SignaLink properly installed and adjusted.

I have noticed that I have to crank up the the SignaLink receive volume to get a lot of signals. I installed the receive jumper to increase the output volume of the SignaLink going into the computer.

The W4RT site says that the Z-11 is not for use on 440/70cm because of known VHF/UHF RF issues, and that they recommend the AT-100.

http://www.w4rt.com/LDG/Z-11Pro.htm "NOTE: Not for use with FT-857(D) or FT-897(D) if you plan to use VHF or UHF. These two radios transmit a small amount of VHF/UHF RF energy out of the HF port and will fool the tuner into tuning. Use the AT-100Pro in this case."

From: john_kb0ne
Topic: 28777 Message: 28785

Not really a problem but the attack and decay of the squelch is a bit fast and can easily trip on sputtering noise. I believe there is a mod in the files section that simply adds a capacitor to the squelch circuit to slow it down a bit. I'm seriously thinking about adding this to mine since I tend to get noise bursts that tends to trip and hold a channel open while in the scan mode.

28786. FT897 over drives a solid state amp

Yahoo group: FT897 (2010)
Date: 2010-01-09 01:01:10 UTC
From: it4dps
Topic: 28786 Message: 28786

I have an FT897 that I'm trying to use with a small home brew solid state amp. When use my Kenwood TS-120 with this amp I turn down the RF power down to about 10 watts and everything works fine, but when I try to use the FT897 I'm definitely over driving the amp.
On the 897 I have turned down the RF Power in Menu # 75, the SSB Mic Gain in Menu # 81 and the AM Mic Gain in Menu # 5. I have also turned off the AGC and the speech processor, but no luck. The strange thing is that when I carrier into the amp it tunes up great. Any suggestions on where else I can turn down the amount of power that I'm delivering to the amp would be appreciated. Thanks - Vince K5VJM

From: humberto gonzalez
Topic: 28787 Message: 28787

I'm just read about theissue, maybe you need to check also menu 80, the radio on FM by default is configured on RF GAIN that means that on 2m is an authomatic squelch. if you change the menu 80 to SQL you can open the receiver.

Seems like a lowpass filter inserted at the output of the HF/6 port would stop that. Obviously it would have to be designed for 18 - 54 mhz, such as the one in this article:

http://www.realhamradio.com/DC_54_mhz_lowpass_filter.htm

Thanks for posting the note from the W4RT site Rich. That certainly clarifies what's happening with this issue.

Yahoo group: FT897 (2010)
Date: 2010-01-09 19:33:43 UTC
From: Dennis
Topic: 28766 Message: 28790

Here may be an easier way;

Turn off (or stop) windows updates. Most are not necessary and only eat disc space. The "critical" updates, however, should be reviewed before you download (as with ALL downloads, for that matter) to see exactly what the update is for and what is being "fixed". The majority of fixes really pertain to a business computer.

On the flip side, the argument of "my computer will be vulnerable", does not apply. Why? Easy - you have nothing a "hacker" wants, really. With as difficult as it is to hack a computer (per se), why would he waste his time on ONE possible piece of meat, when he can attack, say, fifth third bank, sears, or any other system that would glean THOUSANDS of possible hits for personal information? Or, if your computer is used for (home) business somehow and you want to protect your interests and your customers, then by all means do the updates.

At best, your computer **MAY** be used in a series to try to hack something/somebody else, but that is somewhat far fetched.

If you are using the computer at home for email, internet, gaming, radio, etc. these updates are NOT critical, regardless of what Microsoft says.

Firewall, spyware, adware, malware and anti-virus programs, too, are really not that important **IF** you are not downloading hundreds of files or opening emails from unknown persons. Again, most only eat disc space and consume memory.

As well, DO NOT LEAVE PERSONAL INFO ON YOUR COMPUTER! It could be stolen, of course, and used, but as I said before, in the vast majority of cases, you have nothing a hacker wants.

Topic: 28786 Message: 28791

It is the result of the 897 alc not working correctly, a known design flaw. This issue has come up before, and a few months ago I did some measurements on my 897 with an O'scope.

When you reduce output power via menu #75 you will see that on first keydown the output power will be way over the set level. after about 4 ms the output settles back to the set level.

I did not try this with SSB, but I assume the same happens there.

Not all amps are happy with this behavior. As far as I know there is no solution yet. (other than dumping full 100 Watts power into a dummy load, and tapping some power into the amp)

For some O'scope screens see http://www.pa3bca.nl/ft897qrp

I've done this for QRP use to eliminate the QRO spike and it works fine. Of course if you do this you can't apply ALC feedback from the amplifier, or at least not without a more complicated circuit.

No need for a hardware modification. A simple adjustment to the squelch in the hidden extended menu solves the problem. Search the group for info on the extended menu. Beware that messing with the extended menu without recording or backing up the existing settings can get you in trouble. My automatic squelch was a little loose too but it was easy to solve. Unfortunately I did not record my step by step procedure but I remember it was easy.

28795. RE: [FT897] Can't interface HRD!

Yahoo group: FT897 (2010)
Date: 2010-01-10 02:09:14 UTC
From: John Johnson
Topic: 28766 Message: 28795

I can't believe I've read that, and I'm not sure if Dennis is simply a troll but I recommend that readers take no notice of his message because if he's for real he clearly doesn't have a clue about computer security and the reasons for it. To address his points in turn:

Understanding the description of a Windows update is not something you can do in a moment. They don't issue them for fun so just trust them - but maybe as I and many do, don't install them immediately but wait just a few days in case there' s a problem.

Dennis says it's "you have nothing a "hacker" wants, really" and that "your computer **MAY** be used in a series [whatever he may mean by that] to try to hack something/somebody else, but that is somewhat far fetched". Not only is your computer vulnerable but hackers want each and every one of them, to use as 'bots' for many reasons from distributing spam to hacking the Pentagon on their behalf. Why would a hacker try to "attack, say, fifth third banks, sears..." and expose their own connection to discovery when they can have tens of thousands of unprotected PCs with broadband connections do the job for them in a fraction of the time. It's not far fetched, it's happening all over the world a million times while you read this.

Even popular mainstream websites can and are hacked to distribute malware so the "you'll only get them from dodgy websites" argument doesn't hold water. You only have to visit ONE bad site, the other million good sites you visited last year won't mitigate this. And did you let your teenage kids or non-technosavvy parents use your PC? Did you know you're the millionth visitor to this site so you've won a laptop? Simply click here to find out how to...

> As well, DO NOT LEAVE PERSONAL INFO ON YOUR COMPUTER! It could be stolen,

That's right, even in the 21st century Dennis says you should rely on a desk diary for this sort of information - or simply follow some decent computer security principles.

Don't believe Dennis or even for that matter me, but look elsewhere for corroboration because Dennis's message below flies in the face of all sensible security advice. If I can think of one good computer security site right now it's the blog of David Cluley who was technical supremo at Dr. Solomons for many years before moving to Sophos:
http://www.sophos.com/blogs/gc/

So what do I know? I've had a PC since 1985, well dozens of them, many at a time, and by using Microsoft updates, Symantec Anti-Virus, Microsoft Defender and simply not using an Administrator account for everyday work I've never been troubled by a virus or malware on my own PCs, but judging by

the amount of spam I get I'm troubled by that on thousands of other people's.

Be safe, it's a dangerous world out there!

JJ

Subject: RE: [FT897] Can't interface HRD!

Here may be an easier way;

Turn off (or stop) windows updates. Most are not necessary and only eat disc space. The "critical" updates, however, should be reviewed before you download (as with ALL downloads, for that matter) to see exactly what the update is for and what is being "fixed". The majority of fixes really pertain to a business computer.

On the flip side, the argument of "my computer will be vulnerable", does not apply. Why? Easy - you have nothing a "hacker" wants, really. With as difficult as it is to hack a computer (per se), why would he waste his time on ONE possible piece of meat, when he can attack, say, fifth third bank, sears, or any other system that would glean THOUSANDS of possible hits for personal information? Or, if your computer is used for (home) business somehow and you want to protect your interests and your customers, then by all means do the updates.

At best, your computer **MAY** be used in a series to try to hack something/somebody else, but that is somewhat far fetched.

If you are using the computer at home for email, internet, gaming, radio, etc. these updates are NOT critical, regardless of what Microsoft says.

Firewall, spyware, adware, malware and anti-virus programs, too, are really not that important **IF** you are not downloading hundreds of files or opening emails from unknown persons. Again, most only eat disc space and consume memory.

As well, DO NOT LEAVE PERSONAL INFO ON YOUR COMPUTER! It could be stolen, of course, and used, but as I said before, in the vast majority of cases, you have nothing a hacker wants.

From: Lew Phelps K6LMP
Topic: 28796 Message: 28796

With this email, I am saying 73 and farewell (soon) to the many thoughtful hams who have contributed to this list, and to my knowledge of amateur radio generally and the FT-897D specifically.

I've sold my FT-897 and replaced it with a new Elecraft K3 (built from kit).

Why?

The FT-897 is an excellent rig -- my first HF transceiver, and I have no regrets having invested in it. I was attracted to it for its all-band features, its portability, its reputation for excellent if not great design, and its apparent ruggedness. Over the past few years, my interests have changed, and it no longer seemed the best rig available for my needs. I've been bitten by the VHF/UHF contesting bug, and the FT-897 receiver just wasn't up to pulling in weak signals. Some of its operating features made for clumsy band switching and monitoring, which is necessary for VHF contesting. And I found that despite its rugged looks, the front knobs are highly vulnerable to impact damage (as have many others on this list).

Why choose the K3?

First, it's the very best receiver on the market, at any price.

Second, it interfaces seamlessly with transverters, especially Elecraft transverters, which makes contest operation easier. The new "internal" 2 meter transverter has a sensitivity of -145 dB, compared with a published level of -137 for the FT-897. The Elecraft transverters provide the same great receiver performance as the base rig, with a very low noise figure.

Third, although more expensive than the FT-897, its modularity allows me to expand its capability as my budget allows.

Fourth, it offers a built-in second receiver, with exactly the same jaw-dropping specs and spectacularly good filtering capability, so I can monitor 6 meters and 2 meters simultaneously (one in each ear of stereo headphones). The second receiver also offers great opportunity for diversity reception, which can be a boon on 6 meters in sketchy propagation conditions.

A couple of comments:

I was concerned about reported low sensitivity on the 6 meter band (a byproduct of the low IF frequency in the K3 that allows such great receiver performance on lower bands), but a look at specs revealed that sensitivity on 6 meters that Elecraft owners consider really awful is actually the same as the FT-897 provides, and Elecraft offers a preamp for 6 meter that attaches directly to the antenna jack, and improves sensitivity by 9 dB. It switches in and out automatically as you tune the rig.

The portability of the two rigs isn't much different. The K3 "box" is one inch taller and 3 inches wider than the FT-897 (same depth front to back), but if you add the bolt-on tuner

to the FT-897, they're almost the same, and the K3 is actually several pounds lighter than the FT-897 plus the bolt-on tuner. Running QRP, I can power it off an old Sony monitor "brick" power supply about the size of a pack of cards.

The larger front face on the K3 allows for more buttons (and thus fewer three-deep menus), a larger and more legible LCD display with more info, and less need to 'bolt on" additional components such as the tuner and the LDG meter. There's plenty of space inside the 'box" for an autotuner, 2 meter transverter, and --

Lastly, Elecraft support for its customers is legendary. The guys who designed the rig and run the company are regular participants on the Elecraft reflector. Ever seen anyone from Yaesu here? They respond at near-light speed to issues that customers encounter, often posting an update to the rig's firmware within a day or two of a problem being identified. The K3 is very much a software defined radio, and as such is a living, breathing creature, not a static box that becomes more obsolete by the day, by definition, since it's not user-upgreadable. Before I made the plunge and bought my K3, I emailed the company with a dozen specific, detailed and somewhat arcane questions. Less than 24 hours later, I had received detailed, thoughtful answers from the rig's designer.

I'll hang around this group for a week or so in case somebody wants to comment on this posting and I feel I'd like to respond.

And, yes, I've sold my rig to another member of the group who wrote me when he read an earlier post from me saying I was considering the switch.

73, adieu, and thank,

Lew Phelps K6LMP

John,

Firstly, before posting a message calling someone "a troll" you should remind yourself of the fact that as a radio amateur, you are an ambassador for your country. Name calling is not in the spirit of amateur radio, is not constructive, and just makes you look bad in the eyes of others!

Now onto computer security. Perhaps John, you should read some of the excellent articles done by the computer press over the past year both in the UK and in the US, both in the consumer magazines and in the professional industry journals, exposing the antivirus hype that the sellers of computer security software would like us all to believe.

I personally have read 5 of these articles in the past 12 months, by different publishers, and unsurprisingly, they have all concluded something that (having worked in the computer industry since 1973) I have long suspected.

The vast majority of viruses, malware, trojan horses, etc. are hyped up beyond all proportion by the companies selling security software. It's marketing scare mongering, and makes them a fortune in sales! That's how Sophos, Symantec, McAfee, etc. make their money by making us all scared enough of the consequences that we buy their software! Of course if you read something written by anyone from Sophos, Dr Solomon's, Symantec, etc. it is going to justify using their products. If the writer said anything different, they would be sacked!

Exactly the same scare mongering tactics are used on our TV's every day bombarding us with the scary reasons why we must use Dettol, Domestos and loads of other antibacterial products!!! If we all took them as seriously as we take the computer virus threat, we'd all be wearing facemasks, buying cylinders of purified air to breathe and never going out of our homes in case we got infected by a virus that someone had left on the seat of the bus, door handle or bannister in the office, shops, etc.

Many of these tests included having PC's with NO antivirus/spyware/malware software on them whatsoever, and they did not become infected during some quite extensive tests!

The main conclusion of several articles was that if you are using a router, which acts as a NAT (this is the standard situation with the vast majority of home PC's these days), your PC is at very little risk from direct attack. Why? Because its own IP address is never presented directly on the internet and any attempted attack on the router would fail as the router does not run Windows instructions. Unless of course someone chose to write a router virus.....somewhat unlikely as there are so many different makes and models out there, all using different firmware, instruction sets, etc.

Yes, if you keep visiting dodgy sites, such as sex sites, hacker sites, illegal file sharing sites, etc. then yes, you are very likely to pick up something nasty on your PC sooner or later, just the same as you are likely to pick up a human virus if you keep visiting brothels! Also, if you keep exchanging email attachments with people that you don't know and trust, then yes you are likely to pick up the odd nasty, but if you are

sensible, then you will be fine.

I have several PC's. My main desktop has Norton 360 on it, because it came with the PC and my laptop has AVG free edition, more for peace of mind, rather than me actually being worried that I will ever get infected. A second laptop however is an older IBM machine, running Windows XP Pro, connected to my FT-897D and the internet. I use it to access Yahoo Groups, QRZ.com and loads of ham radio sites, as well as for PSK, SSTV, etc. After reading the first of the articles on the hype surrounding viruses, I decided as a test to remove the antivirus/malware/spyware protection running on it and it has never had any infection. And before you say how do I know it is not a 'bot, etc. I can test it quite easily by scanning it from another machine which has antivirus software, so I know it is clean. Funnily enough, despite it being the most elderly of the PC's and therefore the lowest spec, it is also often the most responsive, despite having just as much software on it as the others, as it does not have the overhead of antivirus, firewall, antimalware, etc. software running in the background and using up its resources!

The moral of the story, is think before you believe marketing hype written by so called "experts". Ask yourself if they have a financial interest in what they are writing about. If the answer is "yes" then take what they say with a large pinch of salt! Reading TRULY unbiased reports are far more worthy of your time!

BTW best way to avoid viruses, etc. is to run Linux. Doesn't really matter which flavour you choose. There are hardly any viruses that can successfully infect a machine running Linux.

73's,

Gordon G8WWD

OK, This is where I saw the 'add a capacitor' mod:

http://www.mods.dk/mod/yaesu/DG2IAQ_Modification_Sheet_YAESU_FT-897_Squelch_only.pdf

Need to join modsDK to get in (free). Also I suspect the site may have been hacked and the e-mail addresses have been stolen by a spammer.... don't know for sure but it's best be aware. My WA0LHB(AT)Gmail got hit pretty hard after joining there but then again it could have been any number of sites that had the leak....

I looked at the service manual and it looks like the tweaking of the menu items would be easy enough but this is always scary. There really isn't any info about how the 4 squelch menu items interact.

Anyhow, there ya go, 2 different approaches to the same issue.

try #13 to #16
13 and 14 [(open/close level without RX signal (Threshold / Hysteresis)]
15 and 16 [on RX signal of 3 dBµ (Tight = Enge)]

First of all be shure theat your PS is exactly 13.8V it is very important !!!

One question I have, is what does any of this about PC security have to do with interfacing to HRD?

Danny
KE5WDI

I removed PC security to make HRD remote work properly.

Now I do not have as many problems as I used to.

You are absolutely right, and those who actually read and took on board that I wrote ["I'm not sure if Dennis is simply a troll"] will understand that I didn't actually call him a troll, I merely questioned it in the light of the outrageous statements that he was making. That you didn't properly grasp a concept in what I presume is your native language seems far more embarrassing to our nation. I did not name call, I responsibly brought to people's attention some dangerously bad computer security advice.

I shan't bother responding to the rest. The computer security argument could go on all night, but there's a big difference between seasoned computer professionals using a computer and throwing it open to their families. As they used to say "you pays your money and you takes your choice". Just don't anyone come crying to me if they take the advice of G8WWD or N8BMB and end up with a trashed computer.

JJ

Subject: [FT897] Re: Can't interface HRD!

John,

Firstly, before posting a message calling someone "a troll" you should remind yourself of the fact that as a radio amateur, you are an ambassador for your country. Name calling is not in the spirit of amateur radio, is not constructive, and just makes you look bad in the eyes of others!

Now onto computer security. Perhaps John, you should read some of the excellent articles done by the computer press over the past year both in the UK and in the US, both in the consumer magazines and in the professional industry journals, exposing the antivirus hype that the sellers of computer security software would like us all to believe.

I personally have read 5 of these articles in the past 12 months, by different publishers, and unsurprisingly, they have all concluded something that (having worked in the computer industry since 1973) I have long suspected.

The vast majority of viruses, malware, trojan horses, etc. are hyped up beyond all proportion by the companies selling security software. It's marketing scare mongering, and makes them a fortune in sales! That's how Sophos, Symantec, McAfee, etc. make their money by making us all scared enough of the consequences that we buy their software! Of course if you read something written by anyone from Sophos, Dr Solomon's, Symantec, etc. it is

going to justify using their products. If the writer said anything different, they would be sacked!

Exactly the same scare mongering tactics are used on our TV's every day bombarding us with the scary reasons why we must use Dettol, Domestos and loads of other antibacterial products!!! If we all took them as seriously as we take the computer virus threat, we'd all be wearing facemasks, buying cylinders of purified air to breathe and never going out of our homes in case we got infected by a virus that someone had left on the seat of the bus, door handle or bannister in the office, shops, etc.

Many of these tests included having PC's with NO antivirus/spyware/malware software on them whatsoever, and they did not become infected during some quite extensive tests!

The main conclusion of several articles was that if you are using a router, which acts as a NAT (this is the standard situation with the vast majority of home PC's these days), your PC is at very little risk from direct attack. Why? Because its own IP address is never presented directly on the internet and any attempted attack on the router would fail as the router does not run Windows instructions. Unless of course someone chose to write a router virus.....somewhat unlikely as there are so many different makes and models out there, all using different firmware, instruction sets, etc.

Yes, if you keep visiting dodgy sites, such as sex sites, hacker sites, illegal file sharing sites, etc. then yes, you are very likely to pick up something nasty on your PC sooner or later, just the same as you are likely to pick up a human virus if you keep visiting brothels! Also, if you keep exchanging email attachments with people that you don't know and trust, then yes you are likely to pick up the odd nasty, but if you are sensible, then you will be fine.

I have several PC's. My main desktop has Norton 360 on it, because it came with the PC and my laptop has AVG free edition, more for peace of mind, rather than me actually being worried that I will ever get infected. A second laptop however is an older IBM machine, running Windows XP Pro, connected to my FT-897D and the internet. I use it to access Yahoo Groups, QRZ.com and loads of ham radio sites, as well as for PSK, SSTV, etc. After reading the first of the articles on the hype surrounding viruses, I decided as a test to remove the antivirus/malware/spyware protection running on it and it has never had any infection. And before you say how do I know it is not a 'bot, etc. I can test it quite easily by scanning it from another machine which has antivirus software, so I know it is clean. Funnily enough, despite it being the most elderly of the PC's and therefore the lowest spec, it is also often the most responsive, despite having just as much software on it as the others, as it does not have the overhead of antivirus, firewall, antimalware, etc. software running in the background and using up its resources!

The moral of the story, is think before you believe marketing hype written by so called "experts". Ask yourself if they have a financial interest in what they are writing about. If the answer is "yes" then take what they say

with a large pinch of salt! Reading TRULY unbiased reports are far more worthy of your time!

BTW best way to avoid viruses, etc. is to run Linux. Doesn't really matter which flavour you choose. There are hardly any viruses that can successfully infect a machine running Linux.

73's,

Gordon G8WWD

Jethro,

You might also want to check menu no 85 and make sure that it is set to OFF. I know that this will disable the tuner but when you get finished just change menu 85 back to tuner.

hope this helps

i joined this group because I wanted to pick the brains of most experienced hams than I am. It has provided me with considerable help in guidance in getting the most out of my 897D.

Still, it just takes one bad apple and from my point-of-view Mr. Johnson is our group's bad apple.

He has brought rancor, hostility and infantile name-calling to what has always been a room of mature adults.

If a name acted that way, I would call a time out and send the tyke to his or her room for a time-out. Perhaps, when he has rethought his behavior in the cold light of day, Mr. Johnson will award himself a time-out.

By all means, stay in the group if you can behave like an adult. Otherwise, please go away and give the room back to those who are adults.

Before you go and try this I've been doing some more tests on SSB with this method. Because of the fixed ALC voltage it degrades the desirable voice compression on SSB. The average talk power decreases much faster then what the peak envelope power is being limited to. On CW this external ALC method seems to work okay to control the power. On the digital modes the restoration of the dynamic range associated with the fixed external ALC might be a good thing but I haven't tried it.

I built me a little box with a pot and a momentary push button switch. I used the button to silently key the transmitter and the pot to adjust the power. Both the ALC input and the PTT are available from the same jack. It's pretty handy when used with my SGC autotuner.

This thread is WAY beyond the Yaesu FT-897 at this point.

As a computer professional, I can categorically state, that anyone who does NOT use anti-malware protection of some sort, is asking for a very bad surprise, and...to make it worse, they will be infecting every single person on their email address list.

I deal with computers on a daily basis and I see so many virus/trojan/malware corrupted systems in my daily sojourns that I inwardly wish the courts would treat the bozo's who distribute these things as the criminals they are and sentence them to long years behind bars.

If someone is complaining about spending the money for a anti-malware program, from a company that is just trying to drum up business, then download AVG Free.....Avast is not making a cent/quid/peso, etc. off you then.

Now..let's drop this and get back to the Yaesu radio.

As a retired computer software developer who worked in the industry (including networking and network security) for 40+ years, and who also taught computer networking and related subjects at the University of Washington, I will say that there was more than a bit truth in both sides of the discussion.

As to the comment above by Danny, I only want to add that I run a number of computers (4 Windows desktops, 5 Linux servers), and I have only been hacked once. That was in 1999, using a defect in "BIND" (the software virtually EVERY Unix/Linux DNS server on the planet runs), on one of my Linux servers. My server was one of five used in a "leap-frog" attack on a bank, in an attempt to provide obscurity for the attacker. The bank called me at work (tracked me down from "WHOIS" information). Obscurity (like saying "it's just a home computer") is NEVER a good defense for security.

So, the moral of the story is, ANY computer on the Internet is a VERY REAL target to be hacked, and EVERYONE on the Internet needs a security plan (I think we can all agree on that). I will also add that there is a LOT of misinformation about security on the Internet (and that includes published articles). There's even misinformation about amateur radio! (grin)

As Barry has said, this is not the place to discuss this. If you have questions or comments about any of MY comments above, you can send them to me via Yahoo eMail (if you attempt to send direct to my Yahoo eMail address without using Yahoo, your eMail will bounce due to my spam filter).

Sincerely, Dean Gibson AE7Q

It sounds like your power supply can't handle the current when on 20m, at least not at the power output you were trying to get. What supply are you using? The voltage drop could also be caused by a poor DC connection to the supply.

Steve,

Appreciate your reply.....

I went back to basics and dismantled everything, I then put it all together again and voila !! everything was back to normal.
I also removed soundcard, drivers and reinstalled both, a bit drastic but it worked, It looks like I may have a bad connection on my soundcard so I will replace this...
but to be perfectly honest,
I reverted to the onboard sound and no problem at all.
Conditions on 20m was pretty ropey today but managed to work a few contacts....
I'll keep an eye on this.
Thanks again for your input.

28820. FT897 speaker replacement?

Yahoo group: FT897 (2010)
Date: 2010-01-12 15:18:04 UTC
From: cx7tt
Topic: 28820 Message: 28820

Other than going to the mothership, where can I find an exact, well almost, replacement for the internal speaker? I looked at Mouser and they had a PUI speaker, 8 ohms, about the same size but only good for less than 1 W. The manual shows 2.5 W but is that not the external speaker requirements? Other than that, anybody know the replacement cost from Yaesu?

Call them and ask - 1-714-827-7600. They can tell you. My guess, probably
less than $10.

I vote for stray RF getting into the power supply on 20m. I bet moving all the cables around caused some that were parallel and/or near each other to be separated far enough, or a poor ground connection that was corrected by the moves.

Good evening everyone,

I am still havind trouble with PSK31. I have researched the archives and I find several different opinions on the settings for the 897D. Example.....3 different posts from 3 different individuals on the baud rate settings. I am using a data cable, similar to the one by G4ZLP.
I use HRD and Digipan. I use a HP G60 laptop. Could it be I need to configure the software? Could it be my laptop audio settings are not correct? If someone would be so kind as to give me a step by step method to get me back on the right road, I sure would appreciate it. Thanks in advance for your help.

Hi Joe,

I had a similar thread going I have not got PSK31 perfected yet, perseverance is the key. Two things posted on using the 897-D for PSK31 are:
from Jon KB1QBZ:

Configure your radio for the type of digital mode. As specified on page
39 of the FT-897 manual ("PSK Operation"), for PSK-31 you set the radio for digital (DIG). In addition, you set menu item 038 for PSK. Most people use PSK Upper Sideband (PSK-U), so try that setting.

FT-817 Radio Settings (should be just like the 897)

For PSK31 and other digital modes that use USB, you should set the FT-817 to "User-U" (see radio manual for menu setting) and select "Digi" mode to access it. This will allow you to operate without any unintentional frequency offset, and you will retain full use of the FT-817's I.F. filters.

I'm using a Signalink USB both Digipan and HRDs DM780, but I'm running on a Mac with the PC software in Parallels. My HF antenna is pretty poor (new ham) so I'm going to address that as my next step.

Paul,

Buy a used radio and keep the old radio for parts.

Who knows, maybe there's an Elmer that has the time to fix it for a couple hundred dollars?

What's wrong with the unit and why is the motherboard bad?

28830. Re:PSK31 and the 897D

Yahoo group: FT897 (2010)
Date: 2010-01-15 17:34:00 UTC
From: Don Taylor
Topic: 28824 Message: 28830

On page 37 of the FT-897 and on page 39 of the ft-897D Operation Manual the connections to and from the computer and the radio are well described. However the two most impotent steps are not mentioned. But first a bit of General information. PSK is an AFSK mode and if done in SSB. That mean the information from the radio to the input of the computer sound card is an audio signal. The information from the sound card to the radio is also and audio signal. These signals are of course encoded for the transfer of letters rather then speech. The same is true for RTTY, SSTV, MFSK and all the other AFSK modes.

YAESU has included a special connection to and from the radio via the DATA connector which is a 6 pin MiniDin which supplies the RX output, the TX input and although not needed the PTT signal(s) for all modes of AFSK operation. YAESU placed the RX output of the radio to the sound card on pin 5 and made it a constant level signal that is not changed or affected by the volume control. You can copy PSK or RTTY, SSTV, MFSK and other signals with the volume set to Zero. The Input to the radio from the sound card is on pin 1and is the signal that will modulate the transmitter similar to the Mic input.

YAESU added a feature that is not well documented for the FT-857 and FT-897 called DIGITAL VOX (DIG VOX). The radio already has a VOX Function built in and all YAESU had to do was make it available to the DATA Connector input. This eliminated the need for a PTT control signal from the computer. Menu step 40 is the DIG VOX Sensitivity control and its default is set to Zero. Just enter the Menu and set the value to about 50. The radio will now switch to transmit every time the PSK software goes to transmit.

Now the only thing left to do is to set the level of the TX modulation which is done in Menu step 37 called DIG GAIN. The DIG GAIN default value is 50 which is way to high for PSK operation. Remember you can QSO the world with 10 to 20 Watts of transmit power so set the value to around 5 and check the power out. Adjust it until you have about 20 watts. This was very good planning on the part of YAESU as the DIG GAIN has no affect on the setting of the MIC Gain so you don't have to do any readjustments to go from one mode to the other.

There is only one more thing to do to get to the first QSO. You must to go to the Sound Card control panel and see that everything is set up and working. Because no two computers and sound cards are the same I can't tell you what to do here but you received a little booklet about the sound card when you bought it which will tell you how to get signals in and out of the thing.

One last point. It is good engineering to isolate the sound card and computer from the radio. The best way to do this is via two small and

inexpensive audio transformers that have a transformation radio of 1:1.

If anyone still needs help getting FT-857 or 897 or any other radios connected and running you can contact me directly at info@...

Same $49 buys an FT-meter made by LDG specifically for the 897 and 857. Ordered it mid-afternoon one day from Ham Radio Outlet and had it installed and metering by supper time the next day. It plugs into the outlet under the rig, toward the right side.

It does need DC power to illuminate the meter. I use an external power supply for the 897D. You plug the line for illumination into the back of the meter. That leaves you with a red line and a black line to be connected to something putting out DC. Slipped the black line into the black terminal of the power supply and the red line into the red terminal of the power supply and I had an illuminated meter.

Can't really work PSK31 without a good meter. The trick is to provide just enough power so your signal gets out but doesn't activate the ALC. I use SignaLink USB. I rev up the transmit level of the interface until it crosses the ALC threshhold, then back off transmit until the needle falls just below the ALC threshhold when you transmit.

Don,

Thanks for the great description of the pieces left out of the manual. I for one hadn't realized how Digital VOX played a role.

However, I think that the digital gain value has to be explained just a little further. It appears that your setting of 5 works well for you, but the setting in any individual case is going to depend on the computer, on the computer's output volume, and on the interface. For example, on my FT-897 when I was running an older Dell laptop, I needed:

- About a 27 setting when running the computer's Master Volume at about 4/10ths with a RIGblaster Plug&Play

- About an 18 setting when running with a SignaLink whose transmit gain was set at 50% and the computer's Master Volume at about 4/10ths.

I recently switched to a small Acer netbook and my Digital Gain settings are now 35 and 45 respectively because the Acer's output is not as powerful as was the Dell's.

With both of the laptops, I was of course using the Headphone Out jack to drive the transmitter. When I tried using the Line Out jack on a desktop, I had to set the Digital gain up into the 70% range (with the Master Volume up in the 8/10ths range) because the Line Out delivers output at a much lower power than does the Headphone Out.

There have been various discussions on this board of how to set the volume controls. I have found that what works best for me is to set the computer's Master Volume at 40% (4/10ths), set the SignaLink at about 50% (if I'm using a SignaLink), set the rig's Digital Gain at 0, and then try a transmission while looking at the output power (using the built-in power meter in the rig). Then increase the Digital Gain a bit and try another transmission. Every time I increase the Digital Gain, my output power will increase (duh), but only up to a point. Beyond that, increasing the Digital Gain will not increase output power. The Digital Gain at the point where I get no more benefit seems to give me a low ALC reading (and we want a low ALC reading) and a pretty clean signal (as reported by other stations).

In general, I've found that it's best to not have an extreme setting on any of the two or three variables (Digital Gain, computer Master Volume, SignaLink gain) -- as my output is reported as reasonably clean, but not quite as clean as if the settings are in "moderate" ranges.

Okay, they are undercutting HRO by $5 on the LDG meter. On the other hand, I get whatever I order from HRO the next business day and once I want something, I want it. But I have heard good things about W4RT and have thought of ordering the SSB filter from them.

From: Hank
Topic: 28840 Message: 28841

Yes it will. The FT-Meter is set in the menu of the FT-897. I currently have my external meter set for receive signal on RX and SWR on TX. The built in meter on the radio is set for receive signal on RX also, but modulation on TX.

hth,

Hank / KB4MTO

28842. VHF/UHF Antenna tuner

Yahoo group: FT897 (2010)
Date: 2010-01-17 07:02:17 UTC
From: MM Ali
Topic: 28842 Message: 28842

Dears,

Can someone help me with the make/model number of a automatic vhf/uhf antenna tuner for use with FT 897. willing to buy new or good condition used ones.

Best Regards

MM Ali/vu2ali

From: Carl Wulfestieg
Topic: 28842 Message: 28843

MM Ali-
In most cases, a tuner is not needed for the vhf/uhf antenna. This is because antennas have been designed for the band and are broad enough that retuning is not necessary. Are you interested in a base or mobile antenna? What are the frequencies for the vhf and uhf bands at your location? Are you interested in a vertical or horizontal antenna? Does your FT-897 have UHF or N connectors? This is some of the information needed to select a make and model of antenna.

Hi all!

I uploaded a file "ft897_scales.pdf" to the files section
(http://groups.yahoo.com/group/FT897/files/).
You could print it on a sticker to put on your radio, memorize it or whatever. I don't take any credits or responsibility of the accuracy or correctness of these scales. Many thanks to VA3RSA for the investigation of the scales and posting the detailed results to this group. The user interface of the 897 could be improved in many ways in addition to including scale values. It would be interesting to hack the radio and make an improved firmware. Well, anyhow I hope you find my scales useful.

Tom and Others-

The scales as posted don't agree with my actual views of the FT-897 bar scale and the LDG meter in front of me. Once again, if you want an explanation of the FT-897 bar scale then do the following.

FT-897 Bar Display Explanation

Sign in to the FT-897 Yahoo Group
Click on "MESSAGES"
Search for Message 5278 - You'll find more than you ever wanted to know!

Also, once again, do it the easy way-

Go to W4RT Electronics- http://www.w4rt.com ,
buy an FT-Meter (best $45 I ever spent) and plug it in. Done! It has a very good numerically scaled back-lit dial. (you'll need an external 12 vdc 60 ma source for the illumination) (I modified a junk box 12 vdc wall wart). They also have a larger meter, LDG FTL-Meter (4.5" instead of 2.5" face) for $74.99!

Good Luck

From KD5LBE .... Sewart

If you are using FM get a mag mount and you can use it in your car or in the house and they are good for VHF or UHF. The easiest antenna that a HAM car build is an antenna built for these bands FM as long as you have or can borrow a SWR analyzer meter. If you are going to do CW, SSB, or satellite the suggestions end

You may want to reconsider the use of a tuner at VHF and especially at UHF frequencies. Take a look at this link <http://www.ocarc.ca/coax.htm> to see what a mismatch that is large enough to require a tuner will cost you in BOTH transmit and receive signal strength, not counting whatever losses you incur in the tuner itself! A 2.5:1 SWR on 432mHz will cost you 3db in 50 feet of RG-213 and you will still loose that plus some with a tuner in line.

Mike / W8DN

28848. Buttons Not Responding

Yahoo group: FT897 (2010)
Date: 2010-01-18 03:11:54 UTC
From: dniitani
Topic: 28848 Message: 28848

Hi All,

Is it time to send my unit in for repair? While pressing the band buttons. I heard a loud tone. And now both the Mode and Band buttons does not respond while being depressed. Cat control is able to change band and mode. Any Ideas as to how to return the buttons back to normal operation, or do I need to send it in for repair?

28849. Re: [FT897] ft 897 swr

Yahoo group: FT897 (2010)

From: Tom Ahola
Topic: 28832 Message: 28849

I re-checked my scales and found nothing wrong. Carl, could you specify what does not agree. My scales are based on the same function mentioned in message 5278. The values are rounded and the lower part of the SWR has a slight unorthodox rounding (to have monotonic gradient) but the error is still less than 0.1. Maybe your FT-meter is inaccurate? Analog meters can be sometimes. Bear in mind that neither the FT-897 nor the FT-Meter are calibrated measurement equipment but merely indicators. The actual SWR and power can be off by more than small scale errors. Having an external additional meter to the FT-897 does not fit my purpose of having a portable rig. Knowing the scales of the radio saves money and space. Sorry for my opinion, hope you are not affiliated with W4RT :)

I made a slight adjustment to the scales and re-uploaded. Now only one of the low SWR values have unorthodox rounding instead of two. Enjoy!

28850. Re: [FT897] VHF/UHF Antenna tuner

Yahoo group: FT897 (2010)
Date: 2010-01-18 17:04:56 UTC
From: Tom Ahola
Topic: 28842 Message: 28850

I second the suggestion of Mike / W8DN. Try to avoid a tuner between radio and feed cable at high frequencies. A tuner does not eliminate SWR in the feed cable, only SWR seen by the radio. The power bounces back and forth between antenna and tuner until it has radiated out or turned into heat. With high frequencies cable losses increase and a larger part will be the heat, which you probably don't want. So with VHF/UHF the matching circuit (tuner) should be up in the antenna and most likely is part of the antenna itself if the antenna is not correct impedance as it is. So get a proper antenna and don't use a tuner. It is cheaper that way too.

I disagree,

If you have a 2.5 to 1 SWR, FIX THE ANTENNA its obviously seriously
out of tune and should be tuned properly before use
At I have stated here and in other forums using an antenna tuner just hides
the problem and makes the tranceiver think all is ok by it seeing a
good load.
BUT the antenna is STILL out of tune and is NOT efficient Fix the antenna
!!! :)

I have Never used a tuner on VHF (50MHz) and higher bands I build / buy
antennae that are tuned correctly for the freq of use.

cheers

Dave, you are 100% right !
If you need to try to use a tuner on 6m/2m/70cm you are on the wrong way. Nowadays the antenna designs are so well (f.e. DK7ZB) that you do not need a tuner in any way.I built all my antennas on my own to designers advice on web and all matched 100% with a super VSWR.
If you are sure your antenna is working try to use a other length of coax cable maybe you have a critical lamda length. Just add another length to see if your VSWR is going better or worse.

DE N7UVL,
$.02 worth: If/When using an antenna such as a Yagi cut for
the SSB frequencies, you may need a tuner for the FM frequencies.
The antennas that are cut for a specific purpose, such as Satcomm
and SSB, sometimes have a narrower band width promoting gain
concepts over broad banding concepts. But then there are usually
polarization concept differences between those uses and FM also./ga

I would beg to differ....The FT-897D does NOT have 220 Mhz......perhaps you are thinking of 60 meters...the European radio does not have that capability (I don't think) but the "D" model FT-897 and the "D" model FT-857 has the 5 channel pre-programmed.

The new FTM-350R dual band DOES have 220 capability but only 1 watt.

No, I think isn´t European model, because the 2M band plan:
145.1 to 145.5 - shift
146.0 to 146.4 + shift
146.6 to 146.9 - shift
147.0 to 147.4 + shift
147.6 to 148.0 - shift

And 2M band plan in European version is:
145.6 to 145.8 - shift

see page 32 "FT-897 Operating Manual" in box "ARS Repeater Subbands" :
Version "A"

And about "N" connector in VHF/UHF Port ?

28861. RE: [FT897] 879D in 220MHz Band ?

Yahoo group: FT897 (2010)
Date: 2010-01-19 08:07:29 UTC
From: Geoff Blake
Topic: 28842 Message: 28861

Further to Joe's input, why would European FT897's have 220 MHz, as KB2VEC said, we don't have a 220 MHz band!

Geoff, G8GNZ

Subject: Re: [FT897] 879D in 220MHz Band ?

I would beg to differ....The FT-897D does NOT have 220 Mhz......perhaps you are thinking of 60 meters...the European radio does not have that capability (I don't think) but the "D" model FT-897 and the "D" model FT-857 has the 5 channel pre-programmed.

The new FTM-350R dual band DOES have 220 capability but only 1 watt.

Jon your absolutely right. I selected the number 5 for DIG GAIN to let the TX generate a bit of power and then suggested that it should be adjusted to give the necessary or desired power.

Thanks for the heads up.

Haven't seen so sharp antennas that you can't use for SSB/FM freq. together because of bad VSWR. All my antennas have min. 2MHz bandwidth - I mean my 2m versions. All other designers that I know G0GSK/YU7EF/ DK6BU/Tonna....cover minimum fe. 2m 144-146MHz with a reasonable VSWR.

Erwin:

Probably not a problem on 2 Meters, but could be on UHF. It's a long way from 432 to 445 MHz. Directivity and other characteristics are likely to be a problem with that kind of difference as well.

Hi Chuck,
yes right depending on the design you choose.
look here f.e. http://www.dk7zb.org/70cm/7.htm
That could cover the needs but you are right that some designs are much sharper.

From: f6gwb
Topic: 28866 Message: 28866

Hello all,
I own a FT-897D and I think it is a good rig for its price although I bewail this high level noise at receiving.
Another thing I don't appreciate is the lack of information and documentation from Yaesu to clarify "how it works". For instance, the meaning and the use of each tread of the second level menu. By the way I wonder about if it the same thing (lack of explanations) with the other renowned brands rigs (Icom, Kenwood an so on) ?
Besides, among the numerous questions concerning the FT857D/897D, I don't understand why the HF power limit is 25 watts in AM and 100 watts in FM ? Both of this modes need a permanent carrier, don't they ? (Instead of CW or SSB where the pick HF power can be high as the carrier is not permanent and the average power remains much lower).
Thank for your hints and opinions.
73 to all.
Gerard, f6gwb.

Hi Gerard. Firstly, in my experience all ham radio rig's instruction books from the major players are much of a muchness - things not explained properly or with poor grammar. There may be exceptions, but few and sadly far between.

Re. AM and FM power output. I think the AM output has had to be kept down because of the amount of audio available to amplitude modulate the carrier. Of course in FM mode little audio is needed to frequency modulate the carrier.....

Finally, I've heard of others writing about the high receive noise, but mine seems OK. However, this is my second 897 after the first became faulty and with the first one the noise blanker worked superbly, in this second one not so! My point is that there seems many differences in set-up by Yaesu between individual items. A great pity.

.d. G4TUP/9H3CU.

First, I think the terms used here are misleading. It's 'owners manual'
not instruction books. The OM falls far short of being a book by anyones
definition.

Secondly, it's not teaching you about ham radio (with their radio) It's an
explination of what their radio does.

Not how you may use it.

And lastly, I believe the OM is a translation from Japanese to English.

Rolling all of that into the OM we hold in our hands, we are let down. As
in my case, the FT 897D was my first HF radio. I don't think I understand
much of what *I* can do with this radio as compared with many/most of the
other hams on the group.

But I'm learning :) And most of the group has been helpful, not always.
But by inlarge this is so with the ham radio community enmasse.

BTW Thanks!

28869. gear for a trip to Haiti

Yahoo group: FT897 (2010)
Date: 2010-01-20 12:36:29 UTC
From: ZephyrNYC
Topic: 28869 Message: 28869

Greetings,

I'm posting these questions here because there are a lot of portable experts in this group. I know of a ham who might be traveling to Haiti very soon (within a week), but will most likely be the lone ham in a group of medical personnel. Where are the best places to purchase portable ham gear on short notice? Can you recommend a power system-- models of portable solar panels, batteries, chargers, power supplies, etc.? Thanks.

73,
Frank

The first power system I think about when I hear Haiti is a Glock with 1500 rounds of armor piercing rounds. Kept within arms reach at ALL times.

That way, whatever valuables you learn to bring, you keep.

File that under been there, done that.

He needs a FT897 and a tuner attached. The easiest antenna to carry is a G5RV in an unopened package. I would suggest that he get someones used FT897 since he know it works. What is he going to use for a license? I assume that there is some kind of a reciprocal license arrangement. You can run the radio off of a car battery so I would carry enough 10 or 12 wire to hook it up. DC does looses power over distance so keep the hook up short. If he wants to order one and of the major mail order suppliers can supply one quickly but maybe not quick enough. Skip the gun.

> lower).

Trying to remember back to the days when I built AM transmitters is hard. However, AM begins with a carrier of fixed power. As audio is applied the amplitude (therefore power) of the carrier is increased then decreased at the rate of the applied modulation (audio). On peaks of 100% modulation the carrier amplitude may double. Furthermore, the actual energy in an AM signal is duplicated in upper and lower sidebands, which, if I remember correctly, produces a peak envelope power of 4 times the unmodulated carrier. FM can use a full power carrier since changes in modulation do not alter the carrier power but instead change only the carrier frequency.

Ok guys, did I remember my theory reasonably well for an old guy?

Only reason to skip the gun is if there is absolutely no way
to take one legally. Once you get there you can almost certainly obtain one
from a local source if you have sufficient cash. Remember it is always
better to have a gun and not need it than to need one and not have it.

From: jurgen vogel
Topic: 28869 Message: 28875

Please study a bit about radio communication.On SSB you have 100 watts PeP power that means Peak envelope power. ON FM or CW your carrier power is also 100 watts, on AM your carrier power is 25 watts which together with the sidebands amount again to 100 watts which is the max power output of the rig. OK is it cleared up now???

I am glad to see there are others that don't focus just on the radio piece. There is always a security part, that many don't think about.

My unit was there in the early 90s, its not Kansas, Toto...

But I would take extras with you, a back up to the plan. Coax, connecters, etc.

Have a plan before you go, and stick to the plan. Have a fall back plan incase you need to leave the effected area in a moments notice.

This morning there was UN traffic on 14.3 from Haiti talking to others here in Europe. They mentioned they were using one of the 5mhz freqs too. (NVIS) for comms.

Towns and villages to the north east of Port-au-Prince have electricity to get things charged, and to get supplies, as I understand they have got away unscathed. Not sure what the roads are like.

Greetings,

I'm posting these questions here because there are a lot of portable experts in this group. I know of a ham who might be traveling to Haiti very soon (within a week), but will most likely be the lone ham in a group of medical personnel. Where are the best places to purchase portable ham gear on short notice? Can you recommend a power system-- models of portable solar panels, batteries, chargers, power supplies, etc.? Thanks.

73,
Frank

But the gun would be more like a lightening rod. He's not going to be
traveling in the USA. No second ammendment. My .02 - is a gun will be
more trouble than it's worth.

If you feel you absolutly have to have a gun, don't go.

He needs a FT897 and a tuner attached. The easiest antenna to carry is a
G5RV in an unopened package. I would suggest that he get someones used
FT897 since he know it works. What is he going to use for a license? I
assume that there is some kind of a reciprocal license arrangement. You
can
run the radio off of a car battery so I would carry enough 10 or 12 wire
to
hook it up. DC does looses power over distance so keep the hook up short.
If he wants to order one and of the major mail order suppliers can supply
one quickly but maybe not quick enough. Skip the gun.

Sounds like a great start. A trip to the doctors for some shots (of the
other kind)

Really, this shouldn't be your first trip.

28880. RE: [FT897] gear for a trip to Haiti

Yahoo group: FT897 (2010)
Date: 2010-01-20 18:31:29 UTC
From: Guy Harrell
Topic: 28869 Message: 28880

Consider yourself before you even think about what radio equipment.

Do you have any health issues: heart, diabetes, kidneys, back pain, chest pain, sleep apnea, etc? If so, don't even consider going. Do you take any meds that you can't do without, such as: insulin (refrigeration), etc, or blood thinners, etc? If so then don't go. Are you addicted to cigarettes, alcohol, caffeine, drugs, etc? If so, can you do without? Do you take any other meds? If so, take enough to last the entire planed stay PLUS an additional 50%. You don't want to get there and become part of the problem!

Be sure to carry your own personal emergency stash of water and food. MREs, if you can get some.

Now, about the gun. You might need one but what will happen to you if you actually shoot or kill someone in a foreign country? Personally, I won't go anywhere I think I might actually need a gun. Will I use one in self defense of my family, my home, and myself, you bet.

I agree with the comment below. If you have not practiced EMCOM and not already geared up for EMCOM then don't go.

If you decide to go anyway search Amazon for "emergency communications" books. "The ARRL Emergency Communication Handbook" is a must have. You should order that one and any others that look interesting and have it delivered OVERNIGHT. Also, Google "emergency communications".

The following lists are only a start and NOT comprehensive by any means:

Batteries, battery charger, hand held radio, HF radio, grounding rod, wire, clamps, multi-band HF antenna, parachute cord, power, data, audio, and RF cables and adapters, small repair kit: hand tools, multi-meter, connecters, adapters, fuses, key parts, materials for improvisation: wire, connecters, small parts, insulators, duct tape, etc., photocopies of manuals for all equipment, headphones, for noisy areas and privacy, and much more!

Also, clothing, toilet kit, foul weather gear, snacks, first aid kit, money, telephone calling card, ID cards, frequency lists, maps (both street and topo), key contact phone, email, internet addresses for yourself and other members of your party, resource lists, log sheets, message forms, pens, pencils, paper, tents, tables, chairs, tarps, lights. This is just a start.

Remember, you will have to do without anything you forget.

He gonna be going into "hostile" territory, so to speak. People that are desperate will do things they usually wouldn't. The "security" of a weapon may mean the difference between getting out of a "pop-up" situation alive or in a body bag. If you can get one there legally, do it, or get one once you are there! AND FOR GOD SAKES DO NOT ADVERTISE YOU HAVE ONE, EITHER! DO NOT always rely on THEIR security forces to protect you. YOU are responsible for YOUR OWN safety. They most likely don't care much and are gonna look out for their own a** if the sh** hits the fan.

I agree that a wire antenna of some sort is the easiest and best way to go. Batteries should be able to be had from just about anywhere.

Remember these people were pretty much on the brink BEFORE the quake, they will be much more desperate now, especially since the newest quake.

If you turn up in the UK with a gun you'll be arrested. Check the local customs.

Ideally if you're going to help you'd be going with a charity or group that is geared up to help and you'll be there as part of a plan to help. That means from a radio point of view I'd assume that the group of doctors know that there's someone on the other end listening, or that this person is a doctor going out as a doctor and the radio is "extra just in case". Doctoring is a wonderful skill in a situation like that.

The news we're getting in the UK is how wonderful the country communications infrastructure is and how big corporations are even now reconnecting the internet and mobile phone networks. Maybe that's only in the "important" areas. Amateur radio has not been mentioned in the news. (It didn't get mentioned in the news coverage of the UK flooding, even though it played a part.) It's good that technical skills are useful in today's emergency responses.

I'd suggest making sure the help is needed, and making sure that it is part of a well organised plan involving all the right people. If it was me (not a doctor) I'd ask the charities involved if my skills were useful, though I not be confident that they are because my experience in safety comms is limited to covering long distance sporting events with VHF. The on-air procedures may be similar, but the technical demands quite different.

Consider yourself before you even think about what radio equipment.

I do not think radio equipment is needed at this time .

There are more important thing to do.

The have already requested no more teams unless already scheduled for deployment .

Gerard,

When modulating an AM transmitter with 100% modulation the PEP (Peak Envelope Power) is 4 times the carrier power. That's 100 W PEP output (just like on SSB and FM) with only 25 W of AM carrier. So you're not being cheated.

By the way, that means that if you have an amplifier capable of 400 W PEP, then on AM it shouldn't be putting out anymore the 100 W carrier. Many 11m operators forget this rule, hence all the splatter.

Is there an easy way to send a 10 or 15 watt carrier to tune an Amplifier?

28895. Introduction & Questions

Yahoo group: FT897 (2010)
Date: 2010-01-18 19:10:05 UTC
From: Chuck Williams
Topic: 28895 Message: 28895

Good Afternoon All,

I am new to the forum as of today. I've been considering the FT-897D as my mobile, field day, EmComm rig as I really like the built-in flexibility of the unit.

However, before making a purchase, I wanted to ask this group your preferences in a few areas. I'm just wondering how many are running the internal power supply versus an external; is the internal ps reliable ?; similar question for the Yaesu tuner compared to the LDG bolt-on tuner; are the ranges & reliability comparable?, and finally how "readable" is that little display? I'm stuck with 47 year old eyes that may not like that small screen. I know HRD with the CAT is an option, but can you read the display in Field Day or EmComm situations?

I would greatly appreciate your consideration of my questions. I've read many Eham reviews and know the RX/TX qualities of this unit are said to be good. I certainly look forward to learning more about the 897.

Thanks & 73,
Chuck Williams, KJ4HBK

Subject: Re: [FT897] ft 897 swr

I re-checked my scales and found nothing wrong. Carl, could you specify what does not agree. My scales are based on the same function mentioned in message 5278. The values are rounded and the lower part of the SWR has a slight unorthodox rounding (to have monotonic gradient) but the error is still less than 0.1. Maybe your FT-meter is inaccurate? Analog meters can be sometimes. Bear in mind that neither the FT-897 nor the FT-Meter are calibrated measurement equipment but merely indicators. The actual SWR and power can be off by more than small scale errors. Having an external additional meter to the FT-897 does not fit my purpose of having a portable rig. Knowing the scales of the radio saves money and space. Sorry for my opinion, hope you are not affiliated with W4RT :)

I made a slight adjustment to the scales and re-uploaded. Now only one of the low SWR values have unorthodox rounding instead of two. Enjoy!

From: Keith
Topic: 15848 Message: 28897

My new FT-897D should arrive from HRO tomorrow. I have been going through past messages trying to determine what "must have" accessories are for this unit.

Currently I have a FT-950 and FT-450 (with internal ATU's) for my home station, and FT-857D in my cars. I run LDG Z100 tuners on the FT-857's and have been happy with them.

This radio will be used in our motorhome, replacing the TS-140 I have ran for years.

I am mainly interested in battery pack and tuner options, but the wide variety of choices for this radio are amazing. Is there any particular tuner or battery pack I should avoid?

28899. SSB Power question is my thinking right

Yahoo group: FT897 (2010)
Date: 2010-01-20 13:06:56 UTC
From: skippy_in_space
Topic: 28899 Message: 28899

Ok a sort of new ham type question.

I'm a Scottish Intermediate License holder limited to 50W on HF
My set up is an 897 with a MFJ Mag loop 1769 and auto tuner that comes with it. Running about 20m of coax

I set the 897 to 50% Power (assuming 50% of 100w is 50w)
Go to transmit and the meter on the auto tuner shows a peak of about 20w

The only time I get close to 50w on the meter is when I have the power set at 100%

Now the question is am I in breach of my license as 100% is leaving the radio but the antenna tuner is only showing a peak of 50w. Am I reading the meter wrong or is this typical

Reading through the Intermediate book it actually says to calculate coax loss into your output power.

And for foundation level my tutor set the radio around 30% to get 10w SSB saying that I wasnt getting the full use of my license.

The other reason for the question is I cant have my antenna permanantly installed and I have a ham unfriendly neighbour so am always careful when I operate as its pretty obvious and if I do get an ofcom visit I want to make sure that I'm not making assumptions about power output that are wrong. (I have allready been accused by one neighbour for blocking her Tv recieption, ie all channels are dead but they then convinced themselves that it wasnt me and the mobile crane that was working half a mile away, I did suggest her coax cable at the TV and antenna end as I thought that was more likley the problem)

All the best

Ian

Consider yourself before you even think about what radio equipment.

Do you have any health issues: heart, diabetes, kidneys, back pain, chest pain, sleep apnea, etc? If so, don't even consider going. Do you take any meds that you can't do without, such as: insulin (refrigeration) , etc, or blood thinners, etc? If so then don't go. Are you addicted to cigarettes, alcohol, caffeine, drugs, etc? If so, can you do without? Do you take any other meds? If so, take enough to last the entire planed stay PLUS an additional 50%. You don't want to get there and become part of the problem!

Be sure to carry your own personal emergency stash of water and food. MREs, if you can get some.

Now, about the gun. You might need one but what will happen to you if you actually shoot or kill someone in a foreign country? Personally, I won't go anywhere I think I might actually need a gun. Will I use one in self defense of my family, my home, and myself, you bet.

I agree with the comment below. If you have not practiced EMCOM and not already geared up for EMCOM then don't go.

If you decide to go anyway search Amazon for "emergency communications" books. "The ARRL Emergency Communication Handbook" is a must have. You should order that one and any others that look interesting and have it delivered OVERNIGHT. Also, Google "emergency communications" .

The following lists are only a start and NOT comprehensive by any means:

Batteries, battery charger, hand held radio, HF radio, grounding rod, wire, clamps, multi-band HF antenna, parachute cord, power, data, audio, and RF cables and adapters, small repair kit: hand tools, multi-meter, connecters,

adapters, fuses, key parts, materials for improvisation: wire, connecters, small parts, insulators, duct tape, etc., photocopies of manuals for all equipment, headphones, for noisy areas and privacy, and much more!

Also, clothing, toilet kit, foul weather gear, snacks, first aid kit, money, telephone calling card, ID cards, frequency lists, maps (both street and topo), key contact phone, email, internet addresses for yourself and other members of your party, resource lists, log sheets, message forms, pens, pencils, paper, tents, tables, chairs, tarps, lights. This is just a start.

Remember, you will have to do without anything you forget.

Holy stuffballs, has the US gotten that tight with taking gear on planes?! I know here in .au, it started getting a bit anoying after '911', when those of us with more than one notebook go through the security checkpoints, but not being able to take ham gear onboard?? That seems a bit extreme! When I go away for work, I have three notebooks (normal work notebook, my network/line testing toughbook, and my personal macbook), and I always carry my D7 and a gps (D7 battery in separate laptop bag to the D7). If I'm away for more than a couple of weeks, I usually take my FT8100, though since 9/11, i can't just take a gel cell and charger (no idea why gel cells are now on the not-allowed list?!), so have to have a decent PSU as well, so it tends to stay at home more often than not.. Usually you get asked a bunch of extra questions, and get pulled over for an explosives swab (although that seems to have subsided since I started making jokes about my mother being indonesian, being the reason they always did a 'random' explosives test - they seem to get very touchy when you start asking if they're singling you out because of your heritage..), but they're happy with me taking it all on board, so long as nothing transmits.. (Although last time I did have to pull up the ACMA license database on my PDA and show them that I was indeed a licensed ham..)

I think the funniest security I've had to deal with, was during world youth day last year (no wait, two years ago now! wow) - I was on the networking team, and we had to jump through so many security clearance hoops because we had network gear 'under' the pope's seat at each venue.. Was about 10 pages of information submitted to ASIO, and about 3 months to get our clearances.... Yet rocking up at whichever venue each morning with multiple laptops, a tool bag with all my cabling kit (including butane soldering iron/blowtorch, staple gun, etc), and my ever-present leatherman hunting knife on my belt (seriously checkout leatherman's hunting knife range, they're fantastic! I do sometimes miss having pliers on my belt, but the cutting ability of the blade on the hunting knife more than makes up for it!), I'd line up with the rest of the 'vips' who got to take the shorter-line entrance into the venue, but still going through metal detectors, bag&pocket searches by army folks etc, and then get to the front of the line, wave my WYD staff ID with that magical little red BOH icon on it, and get waved on past the searches, no questions asked.. Could never figure that out?! Or maybe they figured that if I was going to try to off the POPE,

they'd have picked that up during the vetting?!

And just to stay on topic... Make sure the specified portables part of your house insurance covers your gear if you take it to a 'dangerous' country! I know mine doesn't (not that I've been overseas, I just asked out of interest a few years ago when we were doing GIS stuff in iraq. Was told none of my gear, work or personal, would be covered for damage/loss, since it was considered a warzone... I chickened out and sent one of the other guys instead ;))

Cheers,

DG

Set the RF power at 50% as you have done, that is within your licensing conditions. Do not set it higher as that will take you over the 50 watt limit. By its nature SSB power levels will always appear lower than the level you have set in the menu but if you connect a dummy load and whistle into the mic you will get a reading of 50 watts if RF power is set at 50%

>

You don't state under what conditions you are reading 20W on the tuner, but if it is during speech on ssb then you will be exceeding your 50W limit.

The meter on your tuner will not be fast enough to follow the peaks in your speech on ssb, so it will under read.

The only way to get a true reading is to either use a 'peak reading power meter' or to switch to CW (or FM) mode where you get a constant carrier. However, a long whistle on ssb will give you an approximate value.

Don't use AM for you power reading as the AM carrier level will only be 1/4 of the peak 100% modulated level.

Hi Chuck,

Welcome to the group.

I have had the internal FP-30 power supply for a couple of years with zero problems. Very convenient.

I don't have any experience with the bolt on tuners.

As far as display readability goes, that is just personal preference. There certainly are better displays but a lot of information is displayed on the FT-897D.

28908. portable POWER gear for a trip to Haiti

Yahoo group: FT897 (2010)
Date: 2010-01-21 15:29:00 UTC
From: ZephyrNYC
Topic: 28908 Message: 28908

Thanks to ALL of you for all your valuable input.

However, I could have preempted a lot of this discussion had I been more specific with our questions (and subject line). For this I apologize. The ham I'm referring to has been a United States Marine for years, and is NOT asking for tactical advice-- much appreciated though. He has access to a base commissary, PX, etc. for MREs, jugs of water, camping gear, etc. That facet has already been covered.

He also is NOT asking for advice on whether or not he should go to Haiti. His organization already has 150 doctors, nurses, paramedics, EMT-Bs, and Creole interpreters on the ground over there. Those personnel will eventually need to be relieved/replaced by "fresh" medical personnel in order for them to come home and recharge. These replacement medical personnel are making preparations as we speak, type, and read this ;)

I will definitely share and go over this info when we have more free time. Again, thank you all. Keep it coming :)

Hi Again,

Don't know what happened to the message I was typing, but it disappeard--probably got sent before I finished.

Anyway, to complete what I was saying, another important component is a good (and preferably small) tuner. All those rigs I mentioned have good internal ATU's available as accessories, but they won't work on all types of antennas. You never know what kind of antenna you might be forced to use in situations like this. A small MFJ like tuner, that will also work on balanced line fed antennas, is a very important addition to your field gear. In fact, using balanced line is better, since you can multi-band easier, and the feedline will be much easier to deal with than coax. Or, just use a random wire and counterpoise.

Anyway, if I were going to Haiti, that's what I'd use. As for power, you probably will have to rely on batteries, and hopefully you can find something usable down there. A small solar charger would be a good addition too.

Dunno if this helps, but look here:
http://www.action-electronics.com/molex.htm

If you're not sure if it's a molex plug, check this (large manual) out.

http://dw.hampedia.net:8080/downloads/yaesu/ham.dmz.ro.sch_serman_ft-897.pdf

It may even be in the group file drawer. This has got to be cheaper than
buying dead batteries.

28911. Re: Introduction & Questions

Yahoo group: FT897 (2010)
Date: 2010-01-21 18:49:55 UTC
From: JohnB
Topic: 28895 Message: 28911

The FT897D was my first (and still is my only) HF radio. When I set it up my plan was to have it portable for emergency use as well as use it as my base radio for my shack.
To that end I bought an external PS with excess capacity so I could run more than the FT897D with it. So with that reasoning I didn't even consider the internal AC supply. I also have a battery backup for my shack incase of a power outage.
My plan is to eventually put the internal batteries in it following my plan for portable use.
I've heard the LDG tuner is better than Yaesu's. One of the reasons for this is that the LDG FT897 tuner has a CAT port passthrough so that you can still use your CAT port with your computer while using the tuner. The Yaesu bolt-on tuner doesn't have that feature so you lose your CAT port to the tuner. I have a LDG FT897 tuner and am mostly happy with it. I just wish they had an LED to show that it's in bypass mode. Other than that, operating the LDG tuner is a one button operation.
I've had no problems reading the 897's display at any time. There are options to change the backlight color and LCD contrast as well at making the frequency readout larger (at the expense of other info). HRD through the CAT port eliminates any questions about the display, and a netbook running HRD would be usable during field operations. Using HRD limits you to the LDG bolt-on tuner as your only bolt-on choice as you'll need the CAT port passthrough.

Hope this helps.

John - KE7WNB

Hi Chuck,

Welcome to the group.

I have had the internal FP-30 power supply for a couple of years with zero problems. Very convenient.

I don't have any experience with the bolt on tuners.

As far as display readability goes, that is just personal preference. There certainly are better displays but a lot of information is displayed on the FT-897D.

Welcome to the group, Keith.

Of course, for a tuner you might prefer the LDG AT-897, because it bolts onto the FT-897D. I believe it is essentially the same tuner as the Z100.

As for power, I use an Astron switching supply normally, and AGM batteries for emergency power.

After you get your '897, I would be interested to hear your thoughts about the differences between the FT-897, FT-450, and FT-950. I am considering purchasing either an FT-450 or FT-950 and making my FT-897 a strictly portable unit.

wrote:
My new FT-897D should arrive from HRO tomorrow. I have been going through past messages trying to determine what "must have" accessories are for this unit.
Currently I have a FT-950 and FT-450 (with internal ATU's) for my home station, and FT-857D in my cars. I run LDG Z100 tuners on the FT-857's and have been happy with them.
This radio will be used in our motorhome, replacing the TS-140 I have ran for years.
I am mainly interested in battery pack and tuner options, but the wide variety of choices for this radio are amazing. Is there any particular tuner or battery pack I should avoid?

If you turn up in the UK with a gun you'll be arrested. Check the local customs.

Ideally if you're going to help you'd be going with a charity or group that is geared up to help and you'll be there as part of a plan to help. That means from a radio point of view I'd assume that the group of doctors know that there's someone on the other end listening, or that this person is a doctor going out as a doctor and the radio is "extra just in case". Doctoring is a wonderful skill in a situation like that.

The news we're getting in the UK is how wonderful the country communications infrastructure is and how big corporations are even now reconnecting the internet and mobile phone networks. Maybe that's only in the "important" areas. Amateur radio has not been mentioned in the news. (It didn't get mentioned in the news coverage of the UK flooding, even though it played a part.) It's good that technical skills are useful in today's emergency responses.

I'd suggest making sure the help is needed, and making sure that it is part of a well organised plan involving all the right people. If it was me (not a doctor) I'd ask the charities involved if my skills were useful, though I not be confident that they are because my experience in safety comms is limited to covering long distance sporting events with VHF. The on-air procedures may be similar, but the technical demands quite different.

28917. Meter will not move at all on Receive if station is weak

Yahoo group: FT897 (2010)
Date: 2010-01-22 03:06:16 UTC
From: wa4zvg
Topic: 28917 Message: 28917

I am having trouble getting the meter to move at all on Receive if the station is very far away. A repeater here in town that is full scale on my HT and Ft-857 and ft-100 will not even move the needle at all.

Have I missed a menu setting someplace.

It does the same thing on HF is the signal is weak.

Now I can get my neighbor to get on simplex, and he is 4 blocks away and it goes full scale.

What am I doing wrong??

28918. More 'mellow' sounding SSB TX audio out o my FT-897D ?

Yahoo group: FT897 (2010)
Date: 2010-01-21 12:05:03 UTC
From: simon.worsley
Topic: 28918 Message: 28918

Hi Gents

I am trying to get the best SSB TX audio out of my BAREFOOT 2 year old Yaesu FT-897D, using various base mics and adjusting the carrier offset balances menu number 16 and 18.

I have got it sounding as good as I can, but I am still told I sound quite 'narrow and thin' and lacking in 'mellowness'.

I have been advised to buy and install the Inrad filter that can be seen here:
http://www.inrad.net/product.php?productid=15&cat=126&page=1

Has anyone used this flter and can conirm it makes some differences in these respects?

I also found another 897 user (not on this group) who aswell as adding this Inrad filter, also added a 0.22uF across R1543 in the mic amp cct, who swears to me that these two changes made his TX SSB audio sound like a $10k radio not with the standard mic.

Looking forward to your replys, and thanks in advance for your help and comments.

Simon

Why purchase when you can borrow. Contact your local American Red Cross Communications Team or ARES group and ask them for a loan and advice. You might also ask one or two members to show you their "go-kits" so you can see what they pack.

What you take depends on what frequencies and modes you have to support. 40 meter NVIS would cover the area well, but who would you talk to and why? Two meter is good and easy to build a quick 1/4 wave vertical or J-pole and get it up 20 feet or so, but who else has 2 meters? I suspect you will be helping maintain and keep track of whatever radios they already have and are using to communicate between themselves and other agencies.

What you can provide is a back up link to the US or another country via HF. So if a back up link to the US is needed than a NVIS is not what you want, but a horizontal dipole. Same wires and balun, but now two or three poles 30 feet high. I'd go with a 40 meter Windom and a tuner to get a wide choice of bands and I would set up twice a day checks with a few hams in the States to handle traffic, or use the ARRL Traffic Net.

Thanks very much for that, Its what I thought but wanted to double check!

Out of interest for speech on SSB for 50w what would the ATU meter approx read?

I just find the hobby very frustrating at times, Call CQ with no answer, responding to CQ's with out any answer(or they suddenly change to CQ DX or NA), then when all hope is lost you work a couple of stations in the HA-DX comp. or whan as a Novice I worked a few US competition stations on 10w for the big US competition.

Overall though I like the FT-897 but just would like more time to operate as its the whole take the antenna outside, run the coax up the stairs, through the conservatory and then out side, (Have tried each antenna I have inside either at the back of the shack or in the conservatory but high SWR due to the granite and nearly being under ground kills all hope. Have thought about a slinky in the converted loft but again this would have to come down after each session and would be sorounded by Slate on all sides.

Had planned on getting my full in Feb so I could work from my Turkey QTH but have discovered that they still require morse, So I'm debating on what to do first.

Thanks again for the help

Three 897's all set exactally the same. One does not show SWR on the radio meter on FM only. It will show PWR/MOD etc as do the other two. It will show SWR on HF. I connected the FT Meter to it and that will now show SWR either. I know the radio is transmitting. Any ideas ? I did email Yaesu but that was a joke, still waiting for their reply.

I'd be interested in this answer too. My first 897, which became faulty on the VHF-UHF rx side, exhibited this behaviour but the replacement is much better for showing weak signals on the S-meter but still not perfect. I always felt the first 897 was lacking IF gain.... I just wonder if there is a tweak in the engineering menu for the S-meter?

Apologies if I've said something that others don't exactly like.... 'book' and 'instruction' come to mind from past posts....

28924. New FT897D

Yahoo group: FT897 (2010)
Date: 2010-01-22 13:06:36 UTC
From: Keith Carpenter
Topic: 28924 Message: 28924

My radio arrived yesterday. I copied my FT-857D programming into it, hooked up a MD100 mike to it, and started making contacts with it.

I probably won't do the MARS mod to it, as I will be keeping my TS-140 in the camper too, and it already has the capability.

The first QSO I had was on 3.970, everybody thought the radio sounded fantastic. They were discussing how the Dominican Hams got mugged and injured in Haiti, and had fled the island! The ARRL has info on it on the website http://www.arrl..org/news/stories/2010/01/18/11293/?nc=1, and even put it in the latest email. I found it interesting how it re-enforced some of the comments on the list!

I still have a few questions on tuners and batteries, but the responses have been great! Thanks guys!

That is very difficult to answer as it will depend on the inertia in the meter and the way that you speak!! A long whistle will give you an indication something close to the rated o/p, but the peak on speech will depend on how loud you talk and mic gain settings etc.

Here's my 2 cents. I've had my 897 for about 15 months and love it. There is no problem with my 60-year-old eyes reading the display.

Regarding batteries and a tuner, here's my recommendation: unless you're going to be using it in a pedestrian mobile situation and/or absolutely need battery power, I'd recommend an external power supply (Samlex 1223 is what I use--no RF hash, absolutely quiet, and only $100), and an external (non-bolt-on) LDG tuner (I have the LDG AT-100 Pro tuner and love it). My local club, and the local dealer (Associated Radio) both recommended staying away from the Yaesu bolt-on tuner because it was simply awful. The club guys absolutely hate it. As for the internal batteries, the overall concern is that they're expensive and not worth the hassle.

Again, my 2 cents, with the added opinions of a number of other local hams.

Hello Alan

Pushing the Mem / VFO knob allows fast tuning in 1 MHz steps. [push then twist]

Unlike the af / rf knob which is 2 concentric knobs, the vfo knob just looks similar without having a movable outer ring. I did not read the whole manual and found the push option by accident !

All:

Quick note regarding batteries and pedestrian mobile. I did a test a while back running my 897 at 20W continuous key down on the internal batteries and while it was fully enclosed in my rucksack. After 1/2 hour, the radio had barely warmed up. It seems to be quite happy that way. I didn't work up an appropriate antenna configuration for it because I have another mil radio I use in that pack, but it should make a great manpack configuration as long as you can deal with control via the mic.

The knob on my FT857 and FT 897 D, both have a knob with a solid one piece outer ring, no seperate outside skirt... just one solid knob, all one piece ???
has yours a concentric outer ring Ray, ???

73 Peter _____ EI4HX

the outer ring around vfo knob will change freq up and down...73 ray n5iz

_____
From: Peter Grant <ei4hxperimental@...>

Hello Alan

Pushing the Mem / VFO knob allows fast tuning in 1 MHz steps. [push then twist]

Unlike the af / rf knob which is 2 concentric knobs, the vfo knob just looks similar without having a movable outer ring. I did not read the whole manual and found the push option by accident !

73 _____ Peter EI4HX

From: allanndis

What does pushing the knob do besides put an icon on the lcd and disable memory tuning? And what does the outer ring on the knob do? Can't find answers in the (non-indexed) manual.

OK, thanks for the replies.

First, I was mistaken in stating the MEM/VFO CH knob had a moveable outer ring. It only LOOKS like it does. Weird.

However, when I push the knob, it becomes inert. Normally the knob appears to either memory tune or advance frequency by 5 Khz, at least on my setup.

Pushing the knob also displays a small flag icon at the top of the lcd, which is not referenced at all in the manual that I could find. Also weird.

Look thru the menu listings. You can assign certain functions to the knob when 'pushed'. One of these is power level. This seemed like a really great idea until you notice there in no way to know how much you've changed the level! Well, I can spin the knob a bunch to move up or down, sorta. There are some other functions avaliable that might be more useful. The 'flag' is a state indicator.

Subject: [FT897] More 'mellow' sounding SSB TX audio out o my FT-897D ?

Hi Gents

I am trying to get the best SSB TX audio out of my BAREFOOT 2 year old Yaesu FT-897D, using various base mics and adjusting the carrier offset balances menu number 16 and 18.

I have got it sounding as good as I can, but I am still told I sound quite 'narrow and thin' and lacking in 'mellowness'.

In that case do not use a narrow filter, the stock one will sound better.

A 2.7 filter sounds best . A 2.1 makes some women sound like men.

28941. OK to mount VHF/UHF antenna directly to radio?

Yahoo group: FT897 (2010)
Date: 2010-01-22 16:44:25 UTC
From: prybry
Topic: 28941 Message: 28941

I'm thinking about mounting a short VHF/UHF mobile antenna on a 90 degree adapter and directly into back of the radio... Is this a problem? radio acting as the ground plane might be a bad idea?

Need to reduce transmit power?

Thoughts?

Why do this? I'm in MN and 3 ft of snow in backyard is keeping me from mounting a outside antenna until spring...

Thanks,

Brian

28942. Odd pulsing sound thru head set when 897 is connected to computer running HRD

Yahoo group: FT897 (2010)
Date: 2010-01-22 15:43:45 UTC
From: prybry
Topic: 28942 Message: 28942

Last night I finally got a chance to connect my 897 to my computer via a serial/CAT cable... I fired up Ham Radio Deluxe and after a little playing around with settings got everything working great... What a sweet program!

Anyway, my problem started when my wife asked me to turn the radio down... so I plugged in a set of head phones at the radio. Once I did that I noticed a pulse sound that sounded like the radio tuning through HRD. It was clearly linked to the radio in some way since when I turned the radio dial it changed speed... and here is the strange part... when I would press and hold the left mouse button down the pulsing would stop!?!?

The noise is not present with the head phones unplugged...
It does not change in volume when I adjust the volume on the radio...
It goes away when HRD is shut down... but computer is still on.
It changes pulse rate when you change anything on the radio or HRD screen... like the CAT commands are being picked up by the head phones.

Anybody else have this noise issue with head phones on HRD?

I'm stumped... Any suggestions?

Brian

I get this in my setup as well. If I turn off HRD and DM780 it goes away - I think thought he culprit might be DM780 when it goes off then the noise goes away. It doesn't affect receive just comes through the speaker. I didn't notice it until I set the 897 to run at maximum baudrate with the PC. It is really noticeable on 6m or any really quiet band for that matter in SSB.

Although not a mobile antenna, I have been using the MFJ-1717PL "Back of the radio" antenna without any issues. You may want to take a look at that.

I'm investigating the Z11-Pro on the basis that I may in future change radio, though the LDG 897 does have the advantages of powering off the CAT port and bolting neatly to the side of the radio. Does it work with the radio's "Tune" controls? At the moment I'm using a manual tuner, but an autotuner sounds convenient. The LDG tuners seem well received.

I have to agree with e-mail support and large companies as I deal with technical companies regularly with my job. However, I was pleasantly surprised by Yaesu recently. I lost my belt clip for my VX-170, so I e-mailed their support asking how I go about purchasing a new one. They replied thanking me for contacting them, and told me to give them my address and they would send me one, no charge. Five days later, a new belt clip arrived in the mail. Very impressed!

28958. RE: [FT897] auto tunner

Yahoo group: FT897 (2010)
Date: 2010-01-23 14:55:27 UTC
From: Ken Bandy
Topic: 28940 Message: 28958

Mark, there are two tuners (that I know of) that will bolt on the side of the FT-897: Yaesu's FC-30 and LDG's AT-897. When I bought my FT-897D about 4 years ago, I also bought the FP-30 power supply and the FC-30 tuner with it. The FP-30 was a great accessory, the FC-30 not so much. After a couple of months of use, I bought a LDG AT-897 tuner (that also bolts on to the radio), and put the FC-30 back in the box it came in, eventually selling it for pennies on the dollar. The FC-30 will only tune a 3:1 mismatch, while the AT-897 will tune up to a 10:1 mismatch. LDG has recently come out with the AT-897plus. From what I understand, when you press the tune button on the unit, it will cause the radio to tune automatically at low power. With the original AT-897, I manually turn the power down.

73,
Ken

Do you run full power or reduced when you use it?

thanks,

Brian

I guess I don't see the difference between the MFJ-1717PL and the Comet SSB2 on a 90 adapter... both would provide the same ground plane response.

Thanks,
Brian

28961. Re: Odd pulsing sound thru head set when 897 is connected to computer running HRD

Yahoo group: FT897 (2010)
Date: 2010-01-23 17:09:08 UTC
From: prybry
Topic: 28942 Message: 28961

OK, I did a few more tests...
As mentioned in my last posts...
Wireless mouse and wire mouse both have no effect.
Head phone type has no effect...

I played with the polling rate in the HRD program, by extending the rate to 1000 ms it drasticly reduced the frequency of the pulses... no suprise.
I also changed the setting so that HRD stops polling when it's not active... so when I select a different program from the tool bar for example, it stops the pulsing on the radio.

So, it is something to do with the radio picking up the CAT command polling thru the radio... some internal shielding or filters perhaps.
Not sure where to go from here. At least I can make it disappear quickly now by selecting something other than HRD.

Thoughts?

Thanks,
Brian

Topic: 28895 Message: 28962

Good Morning Group,

I want to thanks those who have replied to my reques. I've seen some replies thru the group web psge, but have been w/o DSL the last couple of days and therefore have not received any individual or group reflected emails.

Steve, thanks so much for the heads up regarding the LDG tunrt CAT port pass thru. I was not aware of that difference between the factory tuner & the LDG model. That makes a huge difference in my decision.

Thanks again to all others, I look forward to going through my Inbox for the rest of the messages. To anyone who may have sent me a note that bounced back. I humbly apologize. Please redirect those messages to me if you don't mind.

73,
Chuck Williams, KJ4HBK
PS- This note was assembled using an archaic laptop & dial-up connection that was V-E-R-Y slow. Please forgive any typos! :)

Say Brian,

It may be the timing refresh your hearing in the software program which also is on your computer.
I have had these noises in the past in industrial applications at work and at home in my ham gear....I purchased a quality USB to serial adapter which is truly opto isolated.
All my connections to my radio are opto isolated to keep these odd pulses and computer hums out of my receive.
B & B Electronic has the quality opto isolated cables.

This my not be your specific problem but your descript sure sounds like an isolation issue from computer to radio.

You can alway drop me an Email, we can chat on phone.

Best of luck

Stan

This is what I'm using and it's 'no problems' so far. I tune an OCF dipole.

Even suggestions that aren't the answer are valid, unless the underlying facts are wrong. In this example, I just searched for cat failure because I am looking to fix someones radio, and I did not know about this common fuse problem. That's why this is a forum, it is for multiple ideas and archived for referance of the collective knowledge.

28966. High SWR only with HRD?!

Yahoo group: FT897 (2010)
Date: 2010-01-24 00:44:20 UTC
From: computererds
Topic: 28966 Message: 28966

I have run into a problem I can't get my head around. Every time I tx via cat in hrd, I get an infinitely high swr. I get a normal swr keying the mic, and the keyer, but somehow in HRD, any tx inside of the program gives and infinite swr and then naturally the high swr warning.

This is blowing my mind. Anyone have any idea what this is about?

Brian,

I think this is common in the 897- it is polling noise from the serial port.
No known cure.

The thing I did was add a resistor attenuator in the audio line so that I had to turn up the volume control further which makes it less noticeable then, since it is more a common mode noise not dependent on volume control setting.

Brian,

That was gonna be my next suggestion, but Stan beat me to it. Try buying a different brand of cables, and replace them ONE BY ONE till the noise is gone.

Dears,

Hi,

I have FT 23Rs. Two units have not been used for over 4 years, and I have a very strong reason to believe that the electrolytic capacitors have gone faulty, and I am unable to locate/obtain them in India.

Is there any way you can help?
1. By sending these electrolytics?
2. By selling these electrolytics?
3. Recommending a source for these electrolytics.

Best Regards

MM Ali

I use the LDG AT200 Pro with my FT897D and it works great. I do have an LDG AT897 that I use on my FT857 when on the road in the RV.

Personally I like the AT200 Pro much better than the AT897, but it works fine otherwise.

If you need something "quick and dirty" to run low power for very close repeaters, why not. Why pay for something, just homebrew. Use 19" of romex and solder it to a PL259. You can then bend it 90 degrees up. If you want dual band, solder both a 6 " and 19 " piece of romex and spread them apart into a vee. The rig would be the ground plane. I wouldn't use more than 10 watts on 2M or 5 on .70M since it would be in your face.

Hello group,

When I use an AM carrier to tune a MFJ-901 tuner to an 80 meter inverted vee, my PC's USB goes crazy. It will disconnect, reconnect and tell me it work better with a USB 2.0. I disconnect my CAT cable and the same thing happens. Should I just use CW to tune? (my cheap key is mangle, I'll have to rig something up)

From: Jerry
Topic: 28974 Message: 28974

Hey guys, remember me? I was the founding member of the 'cw crackling' club a number of years back. You know, after all that complaining I did to Yaesu, numerous trips to radio dealers to confirm the problem on other 857's and 897's, etc, I never had mine fixed by Yaesu after they admitted the problem! I guess the battle was all the fun...

I've been lax in operating, mostly listening, and even not much of that for a few years.

I have an FT-897D and FT-817ND and was kicking around the idea of selling both and buying just one radio, most likely a PROIII, FT-2000, or an IC-7600(leading) or the Orion II.

So the reason(s) for this post:

1) What are they worth? I have the W4RT charger and batteries for the 897D. I also have a custom Collins optional 3.2 filter in the 897D. The 897D model has the DSP and has been professionally aligned including extensive bias adjustments and testing to clean-up the PA distortion, another problem never acknowledged by Yaesu. The 817 has an Elecraft auto tuner that works well.

2) Am I going to see that much of an improvement over the 897D when jumping up to the other radios, nameley the IC-7600 which is the prime candidate with a close second from the PROIII?

3) I'm primarily looking for a clean receive signal with hi-function DSP noise reduction. I've designed and implemented DSP externally using ADSP Sharc processors like those used in the high-end radios, in fact my AGC code is used from public domain in at least one of them, but don't feel like spending months getting what others have already done for random noise reduction in SSB mode. I've looked at the timewave dsp-599zx as an external option, but that doesn't sound as good as my design. The problem extends even further, in that once I get my external DSP tuned, I would have to build an external or computer interface for the box. I know the IC-7600 and Orion II have all this done already and reports are that ther random noise redution on SSB is getting pretty good.

So that sums it up. Give me some opinions, please, and if you have the other rigs to compare to the 897D, please chime in.

Jerry, KG6KGP

Say Gang,

I guess I should of give some detail on my USB -to- Serial cable which is Opto-Isolated.

B & B Electronics Part Number.
My cable part number for USB to Serial which uses Opto-isIsolation is: USO9ML2-LS

Try digikey.com they ship overseas and may even have an office in India.

Have you considered that some of the electrolytics can be replaced by off-value components without much effect on operations?

Higher voltage ratings are OK
Valuse of capacitance in power filter subsections can be -20% to >+100%

I've used caps out of newer junk equipment I have scavenged. Particularly, I've had good luck replacing older caps in small places with surface mounts.

28981. Re:auto tunner

Yahoo group: FT897 (2010)
Date: 2010-01-24 19:35:43 UTC
From: Mike_HL
Topic: 28940 Message: 28981

One of the folks at W4RT Electronics talked to me about auto-tuners at Dayton last year, and said that the Z-11 Pro was much better for the money than the AT-897, in terms of memories and tuning features. The info he gave me to read backed this up, and the tuner does work well on HF. What he didn't tell me, and I've found is posted on their website for the Z-11 Pro, is that they don't recommend it for the FT-857 and FT-897D because of the known problems of small amounts of RF being sent down the HF line when transmitting in VHF or UHF. lIn this case they recommend the AT-100Pro, which looks comparable. This is an annoyance, but can be dealt with by removing power from the tuner or putting it into manual mode vs. auto-tune mode when you're operating VHF/UHF.

Overall I'm happy with the tuner, it's working well with my G5RV collinear.

I started to, there are kanji in the US version that you can only get to
by altering the memory data directly via the CAT port and not with the
knob. That is the only thing that I found. I was trying to make an
image of the data but could not find a suitable kanji map, and got
distracted and havent looked at it since.

http://www.0xdecafbad.com/?p=154

There is a graphic of what is in the manual and the values that the
memory can be set to for each icon.

28986. Built the CAT-Mic.doc CAT interface and it doesn't work?

Yahoo group: FT897 (2010)
Date: 2010-01-25 15:14:27 UTC
From: prybry
Topic: 28986 Message: 28986

Over the weekend I built the CAT via Mic interface shown in the file section of this site... CAT-Mic.doc

Seemed pretty straight forward, although I built mine with a pair of punch down style CAT5 terminals and a $10 printer extension cable.

Plugged it in and tried to connect Ham Radio Deluxe (main reason to build the cable... since I have a FC30)

Yes, I did change the microphone setting to "CAT"...
I also played with the baud rates... still would not connect.
The mic works fine, it also has full fuction when the menu is set back to "MIC" so the pass through is working as intended in the build document.
I event went through a pin by pin check with a meter to test the cable, and it was correct (at least as shown in the instructions)

Has anyone built one of these and had it work? It seems like it should take more than 3 wires to communicate with a PC...

Thanks,
Brian

Ryan,

Maybe HRD is activating the split function (SPL) and transmitting on whatever the other VFO is set to. Maybe you're actually transmitting on 160m when you think you're on 2m or something like that.

Other then something crazy like that I haven't a clue.

I have had the same experiece. It is related to the cable connecting the radio and PC. It is more pronounced on some bands. I was able to eliminate it by reducing the baud rate of the serial port connecting the radio. Make sure you change both the radio and the RHD ort speed to be the same.

From: wb9sjz
Topic: 28991 Message: 28991

Has anyone else had a problem with the 897D on the USB/LSB reception where the supression of the opposite SSB is gone and you can receive both SSB's at one time. Changing from USB toi LSB gets you the same reception in full clarity! Has anyone else had this problem and if so, what is the solution???? Please let me know! If I turn the rig off for a few hours and then turn it on again, the SSB's work correct for a few hours and then the receiving both equally starts all over again. I have done a hard reset of the cpu unit a few times and it does not accomplish anything. amateurextra@mchsi.com wb9sjz-George

Hi Willie,
Yeah, I saw that…. But it says nothing about the “tune” icon in lower case verses “TUNR”… It also doesn’t say if you can still get a “H-SWR” with the tuner connected… or just “tune” as in out of range of the tuner. It doesn’t tell you enough. The 857D manual is better but different.

Thanks,
Brian

From: Brian Dallmann
Topic: 28942 Message: 28993

Thanks everyone who responded... I've kind of moved on to the bigger problem of running HRD with a FC30 tuner... I built a mic/CAT cable that doesn't work... now I'm on the search for a better answer to that.

As long as I can make the sound go away by switching applications in Windows, I can live with it... dropped the baud rate to 4800 and it made a big change. Until I get my CAT cable situation sorted out it's fallen down on my priority list.

Thanks again,
Brian

28994. FT-897D: No or little RX signal indication on 2 meter FM only

Yahoo group: FT897 (2010)
Date: 2010-01-25 19:37:11 UTC
From: wbr001ca
Topic: 28994 Message: 28994

Hopefully someone will be able to point me in the right direction for a fix.

Things I've already tried:
1. Rig reset twice;
2. Contact cleaning 5 times;
3. Menu item #80 set to SQL

Local repeater is full quieting on audio but RX on the 897D meter is only showing S6, I have an outboard LDG meter and the RX signal is the same. I've disconnected the LDG meter with the same results. While listening to the local repeater (FM) I've switched to another mode, ie: DIG, LSB, USB, AM and the RX will indicate almost full scale. FM RX on the 897D works as it should on other bands (70cm) and is full scale on local WFM stations.

So I'm pulling my hair out trying to track down what key combo or something I've entered that would knock out the "proper" RX meter indication for the 2 meter band while in FM mode. I'm thinking if the problem were component failure then repeater "audio" signals would be suffering right across the board, but they're not. A repeater 50 km's away doesn't even register an RX indication while in FM but if I switch to DIG, or U/LSB I will get a meter indication between S5-7.

Anyone with any clues as to what the problem may be? If you need more info let me know.

73, de VE1WBR
Brian

Not sure but worth a try ☐ go back to menu 80 and reset to gain ☐ then get on 2m and turn gain all the way open, the go back and change to SQL. Maybe it is keeping the gain setting when you switch and COULD be why you are not hearing much.

From: wbr001ca
Topic: 28994 Message: 28997

Tried your suggestion Dennis (tnx), but still no meter RX indication. Lots of audio on RX'ed 2 meter repeater stations in range. I'm completely stumped on this one.

My only guess would be that "hidden" menu #F10 (FM-FS) needs adjusting, but I'm only speculating.

Hi Brian,

A couple of suggestions:
1 Are you counting the pins on the modular plugs the correct way around and
2 is your CAT interface to the HRD computer expecting to see the 12V (13.8V)
to get its power so that is will work?

73....Eric VK2VE.

Subject: [FT897] Built the CAT-Mic.doc CAT interface and it doesn't work?

Over the weekend I built the CAT via Mic interface shown in the file section
of this site... CAT-Mic.doc

Seemed pretty straight forward, although I built mine with a pair of punch
down style CAT5 terminals and a $10 printer extension cable.

Plugged it in and tried to connect Ham Radio Deluxe (main reason to build
the cable... since I have a FC30)

Yes, I did change the microphone setting to "CAT"...
I also played with the baud rates... still would not connect.
The mic works fine, it also has full fuction when the menu is set back to
"MIC" so the pass through is working as intended in the build document.
I event went through a pin by pin check with a meter to test the cable, and
it was correct (at least as shown in the instructions)

Has anyone built one of these and had it work? It seems like it should take
more than 3 wires to communicate with a PC...

Thanks,
Brian

sorry if this has already been answered

"TUNE" means that you are in an amateur band that can be tuned by the bolt on tuner. small case means you are outside amateur band and can't tune.

You can still get "H-SWR" with tuner connected. Usually when you tune it says "wait" while tuning but if SWR is > 3:1 you won't be able to tune and it will immediately flash "H-SWR" and you can still see HSWR if you try to transmit.

Eric,

I'm assuming that since all the functions on the mic work when switched to "NORM" on the mic menu, all the plug pins are where they belong...
Now for the CAT connections? I'm not sure, I matched up to the diagram and tested each pin with a meter.

As for power... I don't know, the diagram doesn't show any power, only ground, TX A and TX B... if power is needed I'm not aware of it.

Have you built and used this cable? I'm half temped to just order the g4zlp one now...

Thanks,
Brian

Eric,

You might be right... I might be looking at the plug the wrong way and inverting the pins.

By the way the CAT connections are Ground, TX D and RX D

I'll take another look tonight...

Hi Brian,

No, what I am saying is that, on the mini DIN connector, there is 13.8V available, as shown on the diagram you referred to in the files section and also in the manual. This interface, however, does not supply power to that pin so, if the CAT interface cable you are using to the computer is expecting to receive power for its circuitry from that pin, then it may not work without it.

As the interconnection is wired straight through, I would expect any mic to work exactly the same as it does if plugged straight into the radio but, if you accidentally counted the pins from the wrong end, then the CAT interface would not be connected to the correct pins and would not work.

73....Eric VK2VE.

Eric, you are definitely correct.

I'd just like to add that there was no way to provide the miniDIN with the +13.8 voltage, as on the Mike socket on the rig that voltage is not available, there is just a pin providing +5V.
Should the CAT interface need 13.8V Brian has to provide it with an external power supply. Just pay attention to not create gnd loops, which may be source of noise.

Brian, not to mention that I've realized the interface and it works perfectly :-)
I'm sure that after a double-check on the pin connections yours will work as well! I have two CAT interfaces, one USB and another one RS-232; both take the supply from the PC side, so I don't believe that it is a power supply issue, anyway, check it as well.

29005. HRD and Filter Selection

Yahoo group: FT897 (2010)
Date: 2010-01-28 00:55:44 UTC
From: Jerry
Topic: 29005 Message: 29005

I must be missing something, but I can't find a way in Ham Radio Delux to select the optional filter I have in my radio. I looked thru some of the CAT doc available around the web and had no luck there either.

Is it possible to select the optional filters thru CAT?

Thanks

Jerry, KG6KGP

I am sorry but you are wrong, 13.8V is available on the mini-DIN CAT connector, check the manual.

I am using it to power a CAT interface, and it is really there!!!
There is an internal SMD fuse than can blow if you overload it though.

Hi Jeff,

He's not talking about the mini-DIN at the back but an adaptor from the Mic connector, which only has a 5V line, not 13.8V.

73....Eric VK2VE.

I am very surprised that no one else has had this problem that I posted. I receive both ssb modes at the same time: example: On 80 meters where the common mode is lsb, you can monitor a station in the lsb mode and then switch the mode selector to usb and you still hear that station with full clarity instead of the usual non-understanding clickity clack sound. The same happens on the bands where the common mode is usb.

If anyone else has had this problem, please email me to let me know the fix to it, or if I have to send to Yaesu. This radio is only two years old. Yaesu used to have such great quality when the radios were made in Japan. China has nothing close to the quality that these radios used to have years ago.

Hi Eric

I obviously misunderstood what he was talking about!!

Only 5V is available from the mic connector.

Are you sure that you are not listening to a station that is transmitting AM??

That will give tou the effect that you are describing.

They could also be running double sideband suppressed carrier but that would be an odd thing to do since it offers no real advantages other than power savings from not having a carrier. What is really interesting to listen to is ISB which is transmitted by some broadcasters. The upper and lower sidebands are different programs and there is no carrier.

From: Jerry
Topic: 29008 Message: 29012

I've been puzzling over this since I don't understand how the radio could fail in this way. I've heard a number of people recently with poorly tuned Flex radios that were lacking in sideband suppression and as another points out, receiving AM would give you the same effect.

But the 897 uses one filter for both sidebands and they offset the carrier for one or the other, I think. So how could you get both SSBs at the same time? If the filter was bad (going wide or out of circuit) it would act like a DC radio and you would be able to tune both sidebands at the same time but it would sound and tune like a DC coupled radio.

I am thinking that it is more likely the mode switch failing or the switching circuit so what you are really hearing is LSB (or USB) no matter what mode you select.

Does it sound like perfect USB or LSB or when the radio fails, does it sound widerer in audio frequency response? If it sounds wider than I suspect the filter but that is really odd since ceramic filters don't fail that often. If it sounds the same then I suspect the switching circuit is fooling you to thinking it is switching when it isn't. The oher thing to check is to tune a carrier in CW mode and then switch to CWR and see if it is still there.

Jerry

29013. Re: Built the CAT-Mic.doc CAT interface and it doesn't work?

Yahoo group: FT897 (2010)
Date: 2010-01-28 18:29:41 UTC
From: iz0inx
Topic: 28986 Message: 29013

Yes, only 5V from the Mic connector.

This is most likely the problem Brian has: I realized that he is using a Yaesu CT-62 CAT cable and I found a document with the following sentence:

YAESU CAT INTERFACING
[cut]
For use with the FT-100/FT-817/857/897 series you can also use Yaesu's stock CT-62 CAT cable.
This has the advantage of being very compact, and gets its power supply from the rig's ACC connector.
[cut]

So, as Eric correctly pointed out in his first answer, there is a power supply issue.
The CT-62 interface expects to receive the 13.8V from the transceiver, but as said, this is not available from the Mic port.

The software would have to switch from VFO A to VFO B continuously, Read VFO B then switch back to VFO A. If there was any change it would not be recorded in the interim. The constant switching would be a real drag on operation. Yes. it can be done, but it is not practical.

Keith,
If it just kept the last VROb in memory on HRD, it would not need to check continuously... you would likely be changing it "with" HRD and the first time you hit A/B it would refresh the memory displayed and stay "active" only while selected. At that point VROa is held as a memory... and so on. Just toggle the memory and refresh between the two. It could even utilize this memory process on other bands...

Just a thought...
Brian

29016. Best program to export menu settings ?

Yahoo group: FT897 (2010)
Date: 2010-01-29 00:05:48 UTC
From: simon.worsley
Topic: 29016 Message: 29016

Hi all

Thanks for your help in advance.

My FT-897D occasionally resets itself, of course losing the memories and also contents of the menu settings and extended menus.

As you will know it takes some time in re-setting it all up again, so I am wondering wat program I can use - either freeware or happy to buy it - which will easily allow me to export and import the settings incase of reset.

Looking forward to your reply

Kind Regards, Simon

bit biased but I wrote a simple perl script that will use the CAT port
to dump the eeprom of the 897. Its totally free, as is perl on most
platforms.

http://www.0xdecafbad.com/?p=184 just the calibration menu data
http://www.0xdecafbad.com/?p=188 perl module for people that want to
write their own software
http://www.0xdecafbad.com/?p=152 eeprom dumper (I could be encouraged to
write something that will restore it fairly easily)
http://www.0xdecafbad.com/?p=154 memory map for the 897

I find this site useful. In fact, I have their software it does exactly
what you want. Not only can you save your settings, you can edit them a
whole lot easier.

http://www.rtsystemsinc.com/index.cfm Of course in addition to the
software, you'll need the cable. I bought both items for around $40.

Good luck.

Thanks for all your help...
I knew I was missing something.
Well, I took care of it the expensive way... I ordered one from ZLP.
Hopefully that gets my HRD and FC30 working together.

On to the next problem... putting up antennas in a backyard with 3ft of snow and at -15F!

Anyway, thanks again.

A metre of snow I can deal with.. but -26C?!?! holy stuff, I just
can't imagine that! Hiking/Camping trips in winter when its -8 are
horrid enough (you know its cold,when you pour ten litres of fuel onto
a log in a firepit, and the darned thing burns for 10 minutes, then
goes out, and is still frozen!!) How can you even manage to go
outside?! Even handling a steel mast would be shocking, let alone
trying to do up nuts or run rigging! (My missus complains enough
about holding a 12 metre steel mast while I'm running rigging now..
Couldn't imagine her even considering it if it was < 10C outside, let
alone in the minus!

Even stranded wire is stiff as a board at -26C. It would probably take all day just to string a simple dipole if the proper trees were already there.

We just had an ice storm in Memphis, it started at 30F and this AM it was 21F 1/4 inch of ice encasing everything. I'm leaving for Florida next week.

Dave -

I believe that we all would like to thank you for your E. E. Cummings reply to the gentleman with question relative to setting up the tone codes. However, the "tone" of your comment is not in the spirit of amateur radio and certainly not in the spirit of this "Users Group".

73,
Jay/AF2C

Well that was helpful ..NOT. I doubt "basic electronics training"
would help in this case. How do you know he did not buy
the radio used and might not have a manual to read?

It's found in menu mode 083

"1. Press and hold the [A](TON) key for one second.
This instantly recall Menu Mode No-083 [TONE
FREQ].
2. Rotate the DIAL knob to select the desired CTCSS
Frequency.
3. When done, press and hold the [F] key for one
second to save the new setting and exit to normal
operation.

73, and good luck

29034. The optional Colslins 2.3 kc filter for ssb question.

Yahoo group: FT897 (2010)
Date: 2010-01-31 07:06:26 UTC
From: wb9sjz
Topic: 29034 Message: 29034

My filter than came installed in the FT897d has gone bad and it no longer separates the USB or SSB, but instead, transmits on both of the sidebands and receives on both sideband modes on the rig. If I would buy the option 'plug in' Collins mechanical ssb filter, would this bypass the 'bad' filter that came with the rig and operate on the mechanical optional filter only, thereby curing the problem by cutting the filter that came with the rig out altogether???

Please let me know, someone in the know, if I am correct or if this would not stop the problem.

George wb9sjz

I don't think installing a new filter will solve your problem. It sounds as though something is wrong with the switching control unit (mode switch). Try resetting the radio to see if this cures the problem. Can you check menus 15-18 to make sure everything is set at 0?

I have the AT-897 and I love it. When buying my FT-897D, I was going to buy the Yaesu FC-30. Ernie from AES suggested I look at the LDG instead because of the wider tuning range. He already knew I was working with a compromise antenna. I am really glad he suggested it as I can tune 6 - 40 easily.

One question though, I thought the standard AT-897 tuned at low power. Does it not?

Hank, the original AT897 has no way to know what power it is tuning at, or to control the power. The only thing it does with the CAT connection to the rig is get power. However, the FT-897 will automatically cut power on Hi SWR to protect it's finals. I always, as a matter of practice, back the power down to 10 watts on tune up, just to protect the radio.

I used to back the power down to 5 watts to help protect the radio as well, but stopped because someone told me the tuner automatically backs the power down. Thanks for pointing this out; I am going to start backing the power down again - last thing I want to do is damage the rig.

Thanks,

Hank / KB4MTO

29039. 987 F/S

Yahoo group: FT897 (2010)
Date: 2010-01-31 20:37:18 UTC
From: John
Topic: 29039 Message: 29039

Dear Group,

Before I post it on e-bay I thought I would try here first. I have reluctantly decided to sell my 897 (non D, but late serial number in that series). Included is TXCO, SSB and CW filters, and manual. Extras include: AT987 by LDG, and 2 W4RT battery packs and W4RT's charger. It all works excellent. It is in pristine condition. Not used portable or mobile, non-smoker.

The reason to sell is that I also own an 817 which I do use portable, and I have recently purchased another HF rig, so this has become extra, and needs a good home.

Because of all the extras, I am asking $850 but will take fair offers.

Please contact me direct at k2qy@...

73 to all,

John

A bit more context would help. What have you done so far? What problems, exactly, are you having.

Remember: if you want a tone code to be retained, you have to store it in a memory. Memory management is explained well in the manual.

I had something similar, Try cleaning the relays. This can be done by holding the up and down band buttons, while powering the unit up. It should say "relay cleaning" and you will hear it click while it goes through the process. I now do this about once a month, haven't had any issues in the last two years.

29044. No Signal Strength on Repeater Memory

Yahoo group: FT897 (2010)
Date: 2010-01-31 22:34:58 UTC
From: Jay
Topic: 29044 Message: 29044

Hello All,

I have a brand new FT-897 which I have programmed the memory using FTBasicMMO.

On a certain Repeater in the Kansas City area (145.170.00 with a - offset), when the repeater is transmitting, and I am receiving the signal with full quieting, the signal strength meter does not budge. It stays on the left hand side of the graph. Even my LDG FT897 Meter does not move on this channel. I'm sure it is a setting, but as I'm a novice on this radio, I'm not sure which one it is.

Suggestions?

Jay

Hello Dave

Although the FT897 will allow you to enter all the required data for your memory channels, there are some very simple but effective pieces of software to make this job very simple at minimal cost. For one of them simply click on this URL:

http://www.g4hfq.co.uk/ftbasic.html

or paste it into your browser. The software you are interested in is called "FT Basic MMO" and it cost £10, it is well worth the cost.

You can set up as many of the 200 memory channels on the FT897D as you like with the antenna frequency, mode, type of tone CTCSS/DCS, the tone frequency, transmit and/or Receive tone encodeing, repeater offset, simplex of split frequency and a label displayed on the FT897 of either the antenna frequency used or an eight letter ID of your own.
This list of channels is stored firstly on your computer and then, when you are happy with the results uploaded to the FT897. (as well as a number of other transceivers)
You can organise groups of channels into various lists for specific jobs such as:

1. VHF, UHF and HF Beacon frequencies.
2. Local repeater frequencies.
3. Remote repeater frequencies for trips.
4. Groups of 5 split channel Satelite frequencies for FM LEO use.
5. Groups of 18 split channel Satelite frequencies for SSB/CW LEO use.

etc.
These can be uploaded when needed or combined and used in one large group.

The software will allow you to move the channels up or down the lists to suit your requirements.

I hope this helps you.
Regards Allan M0CBG

Good on ya. I think it is best to learn about one aspect and study in from that perspective. Transmitters, modulation and conversion of energy. Antennas, nets of the sky, ground and under (we have many band privelidges with limits). To superhet, or not to PSK. Just a few. Or click through enough tests on web sites and shoot the odds. But, better to know as much to help evolve the hobby.

I prefer:

No-Nonsense Technician Study Guide
http://www.kb6nu.com/2006techstudyguide.pdf

No-nonsense General Study Guide
http://kb6nu.com/2007GeneralStudyGuide.pdf

AD7FO's extra class study material
http://www.arrl.org/es/instructor-resources/ExtraClassSylalbus2009jan-AD7FO.pdf

It gives an explanation paragraph about each test question using the
exact wording of both the question and answer. This makes it easier for
many people to learn the material without learning the incorrect answers
at the same time. 75% of the test is typically "wrong answers" since
its a 4 answer multiple choice test, so it is easier to get lost in
those answers. This way, if this is all you study, you will not be as
tempted to pick a wrong answer because you recall it from some other
study guides that more closely resemble the test itself.

I still suggest that you take practice tests, which will expose you to
those "wrong answers" but while actually studying the material I think
this is the best way to learn.

A note, I have noticed some confusing explanations in the extra guide.
I have notes on them but have never typed them up and placed them
anywhere publicly available. I may do that at some point so that others
can read what I thought was confusing and possibly learn from it. I am
lazy though and generally need prodding to do such things. If I do this
it would be only an addendum, my contributions are a very small part and
I would not want to duplicate the existing guide.

Good choices! Those are the same study guides that I and 12 of my friends used to get our tickets! W1RRS went from no license to Extra in 6 weeks. I went from being a Tech for 23 years to Extra in 3 weeks. Best of all they were free!

Great to have you, hope to hear you on the bands!

I prefer:

No-Nonsense Technician Study Guide
http://www.kb6nu. com/2006techstud yguide.pdf

No-nonsense General Study Guide
http://kb6nu. com/2007GeneralS tudyGuide. pdf

AD7FO's extra class study material
http://www.arrl. org/es/instructo r-resources/ ExtraClassSylalb us2009jan- AD7FO.pdf

It gives an explanation paragraph about each test question using the exact wording of both the question and answer. This makes it easier for many people to learn the material without learning the incorrect answers at the same time. 75% of the test is typically "wrong answers" since its a 4 answer multiple choice test, so it is easier to get lost in those answers. This way, if this is all you study, you will not be as tempted to pick a wrong answer because you recall it from some other study guides that more closely resemble the test itself.

I still suggest that you take practice tests, which will expose you to those "wrong answers" but while actually studying the material I think this is the best way to learn.

A note, I have noticed some confusing explanations in the extra guide. I have notes on them but have never typed them up and placed them anywhere publicly available. I may do that at some point so that others can read what I thought was confusing and possibly learn from it. I am lazy though and generally need prodding to do such things. If I do this it would be only an addendum, my contributions are a very small part and

I would not want to duplicate the existing guide.

Hello Mohd,

Thanks for the reply.

No luck with resolving the issue. The rig is a bit over 2 years old, of which I bought new and I've only had it on about a dozen times in those 2 years.

Since I had not used it recently I could have pushed a wrong combination of buttons while trying to access a menu. (to lazy to dig out the manual)

I could have inadvertently pushed the "A" key during "power on", or any combo of the "A-B-C" keys during power on.

However, I subsequently have done 2 full resets of the rig, and went through 5 contact cleaning routines thinking that perhaps the contacts could have been dirty. Doing the above should have reset any "wrong" key combo I may have selected, I would think.

As I stated in my first post, RX on other modes on 2 meters is where it should be, although I believe PKT mode is also affected, but not DIG, U/LSB, CW/CWR. FM RX meter indication on a "full quieting" signal only shows S4-5.(local repeater) If I switch to say DIG while the local repeater is in use I see a meter indication of almost full scale.

This problem has me stumped.

If there is a component failure I wonder how it would be possible to RX "audio quality" (full quieting) from a S4 signal. (should be S9+60dB) Other 2 meter FM repeaters show no RX meter indication, but when switched to DIG mode I get "near" correct signal strengths for the appropriate repeater.

Just for fun, I should take a look at the current Extra syllabus. I went through the old path of five exams and found the Advanced to be the most difficult of the five. I haven't checked to see what was done with the old Advanced syllabus when that class was eliminated.

grin that should be a fairly simple AH of battery / ~10A = transmit time in hours ? :) Of course, you wouldn't be transmitting non-stop, so you'd get somewhat more :)

My DieHard Platinum P3 AGM lasts about 14 hours at about a 10% transmit duty cycle.

Drops to about 8 hours at 30%. You might get as much as 6 hours at 50% before low voltage shutdown. It really depends on the ratio of transmit to receive time.

I HIGHLY recommend the purchase of a "Doc Wattson" meter to monitor your battery power when portable. "Doc" will keep you informed on how much power you're consuming and approximately what's left in both power and time. Well worth the $60 is you're doing alot of portable work to protect an $800 radio......

Matt,

As noted there are a number of variables to consider.
There really is no absolute answer to the question.
One of those "sortta depends" things.

For example, will you be at a places that you can charge
the battery when not in use? or hook it up to the car
and charge it like with the normal battery for the
starter? People that toat boats and trailers have that
set up for their boats, trailers and rv's.

When I go out and camp with a tent, I toat along a deep
cycle marine battery and solar panels that works rather
well for keeping it charged in good weather.

I really don't know the answer to your question because
I introduced a variable because I fed the beast <LOL>.

What I can say is the radio was on 24x7 for 7 days with
some transmit time. At the end of the week it was still
nearly fully charged.

Might tell us your plans for the road trip and maybe
some of us can catch you on the air.

Good luck with the trip and have fun

Hi Scott,

I've got to go to Baton Rouge on a business trip and it's about a 8 hour drive for me. I'm going with a colleague from work and he's driving so I thought I'd take my FT-897 a deep cycle marine battery and a 20m hamstick on a mag mount and play on the radio while on the way down there. The guy I'm riding with doesn't really know what to think about amateur radio. He used a CB a lot back several years ago and I think he compares ham radio to being similar. I thought it might be a good opportunity to show him the differences and maybe even talk him into taking the test. With any luck the band might be open and make a couple DX contacts. If that happens, I think I'll have him hooked. J

From: wb9sjz
Topic: 29061 Message: 29061

If the mixer crystal goes bad, would this cause the radio to transmit and receive on both side band modes at once??? This problem was intermittent but getting worse by the day . Trying to narrow this problem down. The radio works great on the a.m. mode.. Also, when this ssb problem happens, it also degrades the receive on the ssb modes as they do not sound like normal ssb and the signal strength is taken back some too when the problem happens.

Not having a circuit diagram or service manual present, here is my guess:
There is usually a filter to remove the unwanted sideband and carrier.
If the filter goes bad, you would get essentially crappy AM all the time.
(Both side bands and a carrier).

Anyone successful in the soft jumper MARS/CAP mod on the Yaesu FT-897D. I tried last night, but no go. I will double check my connections, but I think I have the cable in the correct ports. I'm using the Yaesu USB CT-62 CAT Interface cable. Maybe I'm using the wrong port on the radio. I'm running HRD with the cable interface, and no problems with HRD (which is a cool program).
Input please.

Thank you!

I believe there was a problem with some 897's and it was to do with the filters. Yaesu repaired them under warranty - TWO filters were replaced.

Don't know if that helps at all but it has to be either the filters or the carrier insertion oscillator crystal I would have thought.

Hi Sean,

The "Soft Jumper" does not work on the FT897D. You will have to have a hardware modification to incorporate the MARS/CAP mod.

Anyone successful in the soft jumper MARS/CAP mod on the Yaesu FT-897D. I tried last night, but no go. I will double check my connections, but I think I have the cable in the correct ports. I'm using the Yaesu USB CT-62 CAT Interface cable. Maybe I'm using the wrong port on the radio. I'm running HRD with the cable interface, and no problems with HRD (which is a cool program).
Input please.

Thank you!

29070. RE: Confirming Mode for PSK31 & Nomic

Yahoo group: FT897 (2010)
Date: 2010-02-06 11:29:24 UTC
From: Jon Perelstein
Topic: 29068 Message: 29070

>>Mode needs to be set to USB to operate PSK31 with Rigblaster Nomic (which interfaces to FT897
via mic jack). In DIG mode I found PTT would activate but no with
output, I suspect this is due to nothing being connected the CAT port
(ie no incoming data so no output)...

When all else fails, read the manual.

The CAT port is used for computer control of the rig -- frequency, mode, etc. It has nothing to do with your incoming data. If you try to feed your incoming data into the CAT port, at best you will accomplish nothing, at worst you will damage the circuitry.

The DIG mode is used when you're interfacing your incoming data via the DATA jack in the back of the unit. Since you're not interfacing via the DATA jack (you're using the microphone), you should not be in DIG mode.

The digital menu settings (e.g., menu item #38) only apply when you're in DIG mode.

The nomic manual pretty much explains it all when it comes to running PSK on a rig that is using the microphone as the interface point.

I am using in menu #38 PSK_L, in DIG mode, CAT control and home made sound iterface on DATA jack.
Softaware is MixW and I used also for RX 300Hz filter ... with "ALIGN" on 1010 Hz on the waterfall ...
For RTTY in #38 RTTY_L and ALIGN on 2045Hz..
In MixW Dig (YAESU) is LSB.
For me is OK !

29073. cw with hand mic

Yahoo group: FT897 (2010)
Date: 2010-02-06 14:57:00 UTC
From: bragucci
Topic: 29073 Message: 29073

When I purchased my 897 back in August I remember the AES sales person telling me I could use the hand mic to send cw. He mentioned using the up/dwn buttons on the mic to send code? Anyone ever heard of this?
Also, as I write this I am listening to 40m SSB. The AGC is off, I'm showing a noise level of s3. I turn on AGC and the noise jumps to s8. I just changed to 20m, AGC is off and the noise is at s4, I turn on the AGC and it stays at s4. Why the difference?

Thx
Bart

Without having the manual handy, if memory serves, there is a menu, though I don't recall which one, that you switch from KEY to MIC. This allows you to use the up and down buttons on the microphone for the dots and dashes. I used if for a short time until I bought my first key.

From: bragucci
Topic: 11796 Message: 29077

Ok, now that I know how to use the hand mic for CW I want to give it a try. The radio has an "electronic keyer" from what I've read. What does this keyer do? How will it be of benefit to me as I begin to work CW? Am I correct that I can also set a CW message into memory and send it automatically rather then keying it in? For example I can set cw,cw, this is kd8gtp calling cw, to automatically send rather then having to key it in each time? This cw is rather new to me and input would be appreciated.
Thx

Look up the CW operating page in the owners manual, and you will find the keyer sets up speed and spacing of dits and dahs. There is a beacon feature for a preset message ie. cq de your call. It is used by the menu ply 1 ply 2 and ply 3 below the screen. It is all explained in better detail than I have done here. Good Luck .   Paul KB2VEC

Hi!

We are fairly new at this.
We're getting swr readings on 2m and 70cm fine using a Diamond antenna, but are getting no swr readings at all on HF using a GAP vertical.
Hooked up an swr meter, same results.
Just got an MFJ 945 c manual antenna tuner and also can't get any swr readings.
Hooked up the GAP to an antenna analyzer and do get swr readings on the antenna.

Any help would be appreciated.

Thanks and 73s

While SWR is a good measure to look at, a more practical test might simply be to communicate

With someone on a frequency.

If you have clear communications both ways, which you often do, even with a reasonable SWR,

Then why do you really care what is the SWR?

How are you trying to measure your SWR?

If you are using ssb there will be no carrier, hence no reading, unless you actually speak into the mic.

You must use a mode that has a constant carrier for tuning and reading swr, such as CW.

29088. jumper settings

Yahoo group: FT897 (2010)
Date: 2010-02-08 07:17:13 UTC
From: Trixter aka Bret McDanel
Topic: 29088 Message: 29088

I have seen many people talk only about the jumper setting for freebanding (which really isnt freebanding but meh). I have typed up the information on a Yaesu document on what the jumpers really mean. This way people can make more informed decisions about what mod they want.

What I do not know at this time is what jumpers 1004, 1005, 1006 do. If anyone has documentation on that I would greatly appreciate it.

this is a precursor to writing a free app that will do a mod via software only. Yes there are others out there, mine will be a perl script using the perl module I wrote just to give people yet another option.

The short version is you just write to memory locations 4 & 5 for the jumper settings and power cycle the radio. If you reset the radio then it will reread the hardware settings and go back to the way it was.

For those that are interested in the raw information:

29089. Re:Adjusting ALC for psk31

Yahoo group: FT897 (2010)
Date: 2010-02-08 10:31:33 UTC
From: Jon Perelstein
Topic: 29087 Message: 29089

In general, PSK31 is operated at no more than 30 watts power output. Given that, West Mountain Radio (the people who make the RIGblasters) recommend the following:

1. Set the radio's power output at or near full power

2. Adjust the computer's sound level, the radio's input gain*, and the gain on your interface (if your interface has a gain control) so that your transmission is getting the output power you want (e.g., 30 watts). As much as possible, you want to keep each of the individual controls (sound level, input gain, interface gain) toward the middle of their settings range so that you get absolutely minimal distortion. In practice, you'll be below the middle of their ranges, but try to not to have any of them rock bottom.

The result will be a nice clean signal with no ALC activity. For PSK, no ALC is even better than just a little ALC.

* If you're interfacing through the data jack, you would set the digital gain (menu item 37). If you're interfacing through the microphone, you would set the SSB mic gain (menu item 81).

Subject: [FT897] Adjusting ALC for psk31
To: FT897@yahoogroups.com
Date: Sunday, February 7, 2010, 10:30 PM

I have just moved me 897d into me shack and want to setup it for psk31. I am running it into a SGC239 with 100 foot of wire. How do I and what do I adjust to reduce the ALC to next to nothing (as recomended for psk31)

Here is the same headset at Amazon.com
You will have to convert to the RJ-45 connector I would bet.

John,

Try reducing your output power to the minimum necessary to tune your MFJ-969. Then, once you have the MFJ-969, try increasing the power and noting where things go haywhire. My radio will do the same thing (only on 15M) if I exceed 10W output. It is caused by stray RF in the shack, at least in my case.

29098. digital speeds above PSK31

Yahoo group: FT897 (2010)
Date: 2010-02-09 14:10:06 UTC
From: Ronald West
Topic: 29098 Message: 29098

MY FT-897 will not decode digital speeds above PSK63. That is for all modes. PSK63 and below work perfectly. I have changed the settings on menus 71,72, and 73 with no results. I use the Signal Link USB as my interface. All of the speeds will decode perfectly using my FT-7800R but that is just an FM 2M radio.

Any suggestions, the 897 is not a D model, it was manufactured in 2003.
Thank you,

Ron / WB3ILX

Apparently there is a lot of stray RF floating around your shack I recommend that you make a dipole antenna similar to the G5RV and a proper grounding system..

Good luck..

or it would be a power supply that does not output enough power. I have seen the radio shut off like that if the supply is inadequate for whatever reason. The fact that it shuts off at a 2:1 SWR tells me that the radio is kicking up the output power based on SWR and causing it, but that is just a guess.

The radio has a built in feature to lower output power automatically on a higher SWR, this feature may not be disabled in any reasonable way. As a result, when the power output increases so does the power draw from the supply.

My recommendation is to try to see if its rf in the shack or a power supply that does not output enough or something else entirely.

John:

As one other posting mentioned, it's possible that it's a power supply issue. It's easy to test if it's an equipment or RF issue if you have a dummy load you can put on the radio.

Your antenna configuration is exactly the kind that can cause RF in the shack. I assume the antenna tuner is in your shack and the antenna starts there. I also assume you have a ground line from your tuner to some kind of ground or counterpoise. With this setup, you are guaranteed to have significant RF fields in proximity to your equipment.

That doesn't mean you can't make things work. The first thing is to minimize RF being conducted from the tuner to the rest of your equipment on the outside of the coax and any power supply connection to the tuner (common mode). Since the antenna you're feeding is certainly unbalanced, you will have common mode currents. You try to minimize that in a variety of ways. One would be to have the tuner feed open-wire (balanced) line and run that out of the shack to some point where it feeds the long-wire and ground (counterpoise). Even with a balanced feed, you may end up with RF currents on the tuner case.

To keep RF from getting to the rest of your equipment you'll need "choke" the RF on the coax and power cables feeding the tuner and try to keep the tuner some distance (at least a couple feet) from other equipment. You'll also have to isolate your equipment ground from the ground you use as the counterpoise for the antenna. This will bring up all kinds of discussion regarding how to accomplish that, but the concept is to simply keep RF at the antenna and away from the equipment. If your tuner is connected to the long-wire and a ground, the ground is part of your antenna and WILL have RF on it, so you have to isolate your equipment from that for RF.

Also, being in close proximity to the antenna, all conductors in your shack will pick up RF. You may have to put chokes on everything going in and out of your radio equipment. This means, power, coax, computer interface, speaker lines, and perhaps even the mic cable.

Tell us more about how you have the antenna and ground (counterpoise) run and how all the equipment is located.

From KD5LBE This radio runs on batteries so power shouldn't be a problem, the radio just reduces its output power. I assume that you have checked the voltage and you are getting around 13 volts. I also assume that you have grounded the radio and the antenna separately. I apologize for this but there are two antenna connections on the back and you did look and me sure you are connected to the right ones. I say this because I have to look and see that I am on the right one for the right antenna. Most everyone else has done this from time to time. 73s

grin How do you confuse an SO-239 for an N connector? It's a bit hard to plug into the wrong socket :)

Or does the US version use two SO-239's??

Damien:

Yep, the US version does have two SO-239s.

You do know, though, that the shield threads are the same between a PL-259 and an N male. While it's hard to plug an N male into an SO-239, you can plug a PL-259 into an N female connector. If you're successful, it will spread the center connection on the socket and ruin the connector. I've seen a radio or two where this has happened and had to repair one. (Nope, I wasn't the one who did it.)

29107. Which tuner? SG-237?

Yahoo group: FT897 (2010)
Date: 2010-02-11 04:52:13 UTC
From: ZephyrNYC
Topic: 29107 Message: 29107

Greetings,

Which tuner do you use with your 857 or 897 (D model or original)?
Aside from a tuner's ability to clamp onto the 897, why did you choose
that particular tuner?

Do you use the SGC SG-237? If so, how durable is it? Have you ever
had any problems with it? Thanks.

I have been doing A LOT of research . And I like the YT-100 for the FT-857d . and that□s what I am going to get I have talked to many a ham who did not like the tuner for the FT-897d that bolts onto the side. There was concern about it not automatically dropping the transmit wattage. Personally I bought the 857 instead of the 897 because it was smaller and would be easier to mount with a tuner. Right now I am using a Chameleon Antenna that doesn□t need a tuner. But the YT-100 is next on my list

I have used the LDG YT-100 for nearly a year and highly recommend it. It doesn't bolt onto the side of the radio, but is compact, light, and flexible. It tunes a wide range of bands (I use a G5RG-lite)quickly and remembers old settings. It automatically switches the radio to low power and AM and returns it to its former state after tuning. It's external coax connection could be more robust, but I haven't had a problem so far.

29110. Which Tuner

Yahoo group: FT897 (2010)
Date: 2010-02-11 12:39:19 UTC
From: Keith Carpenter
Topic: 29110 Message: 29110

All of my experiences with LDG have been very good. I run the Z100 with my Icom 706 and Yaesu Ft-857D. When I bought the FT-897D I ordered the LDG AT-200 Pro with it, and I haven't had any issues. The LDG tuners will tune anything I have tried so far, and I run them on MARS frequencies that are a fair stretch from "resonant". Of course I use either a 1:1 or 4:1 balun on wire antennas, and I am using hamstick whips that are at least in the same band.

I wish I could say the same for the internal tuners on the FT-950 and 450........ on my 5BTV vertical they might give an extra 50 Khz on 80 meters, where the LDG's will give at least 150 Khz.

It all comes down to what you are trying to tune. Stories I hear about the SGC would indicate you could tune a wet string with it.................. but a low SWR at the radio is never a good indication of how well you can "get out", or even hear.

I use the LDG 897. I love it - I personally like the bolt on feature. It makes it far more convenient to take it with you if the need arises. And it will still work with a much wider initial mismatch than the Yaesu tuner.

Topic: 29107 Message: 29112

I use the LDG AT-897 and I really love it. It is true that is doesn't automatically reduce power, but that is no big deal for me. When I jump bands, I drop power, push the tune button, and bring the power back up. I understand that the AT-897 Pro automatically reduces power.

I have a 19' dipole in my attic. So far the AT-897 has tuned 6, 10, 12, 15, 17, 20, 30, 40, 60, and 80 meters. Needless to say on 60 and 80 I didn't make a single contact, and I wasn't expecting to be able to as a tuner cannot overcome a short antenna. But it does go to show just how good of a tuner this unit is.

I also us the AT-897 on my radio and it tunes my G5RV on every band except 160. The AT-897 I personally believe would tune a wet noodle to acceptable SWR range. I have made good contacts on every band except 10 meters mainly because I haven't found anyone on that band lately. I also like the fact that it bolts to the side of the radio and takes up very little room in my very limited shack space.

I use the LDG AT-897 and I really love it. It is true that is doesn't automatically reduce power, but that is no big deal for me. When I jump bands, I drop power, push the tune button, and bring the power back up. I understand that the AT-897 Pro automatically reduces power.

I have a 19' dipole in my attic. So far the AT-897 has tuned 6, 10, 12, 15, 17, 20, 30, 40, 60, and 80 meters. From: Jim N7TCF
Topic: 29107 Message: 29115

I've used the SGC 237 for a couple years now. It has a wide matching range and is somewhat weather-proof. The 237 is pretty rugged, but read the specs carefully. 100 watts CW assumes a SSB like duty-cycle. Much like the 897 itself, it will hold up to 100 watts brick on the key for short periods.

I think an outboard unit is more versatile, and has a wider match range than most bolt-ons. It really is designed for unbalanced end-fed or vertical antennas. Open-wire can be attached without much difficulty. Power consumption is low and the processor is radio-quiet. I've used my 237 in my truck and remotely mounted at home.

I have had no trouble with my 237. It has limits, it won't match my mobile 8 foot whip on 75m. It sometimes can't find a match for my random long wire on 15m. Every installation will be different.

You can damage it with some effort, like excess power or static discharge from large antennas. The design assumes your solid-state rig will fold back during the matching phase, keeping voltages within limits. Misadjusted SWR protection is another way to damage the tuner. The transmitter will produce very high voltage and possible arcs during the match. Not too good for your rig either.

Hi Frank,
I have had the SGC 239 remote tuner for about a year. It is mounted in the shed where I keep my old motorcycles. The 40m rectangular loop is connected to it at one corner, then the feed to the rig by approx 15m of coax. It tunes the loop to better than 1.3 to 1 on all bands, including 160m and 6m. It works a breeze, and I recommend it. My friend also bought one on my recommendation to feed a multi band open wire feed doublet. He is well pleased with it too. A tuner at the antenna is nearly always going to give better results than one in the shack, as high swr may well be present on the feeder from the aerial to tuner. In the remote tuner system, the coax is matched.
To remote tune the antenna is easy. Knock up a lead with a 3.5mm plug and push switch, connected to the ACC socket, the correct connections are in the manual. Just push the switch to enable transmit of a carrier and the tuner does its work, in my case usually in a couple of seconds.
Cheers, Bill, G6BCC

Frank,

I've used the SGC SG-237 for about ten years now with no problems. I agree with Jim's comments. I use it with 3 W to 100 W from 160 m to 6 m with an inverted-L antenna 20 m long. I just have to protect it from the Texas hail and sun with an up side down plastic trash can from Walmart.

I Have the LDG AT897 and the MFJ-993B and have run them side by side now for over a year. The one that comes out on top with better performance and less susceptible to RF in the shack is defiantly the MFJ.. The only thing the LDG is better at is the relay sound level being quieter and it will tune 50 mhz...but that is no great deal as most 50mhz antennas are tuned properly any way...

The MFJ is now used all the time as the main ATU in the shack and the LDG is relegated for use in the Camper / RV along with my FT-857.

Hope this helps with your quest for the best ATU

My 6 month old LDG AT 897 just quit on me. I have no output unless I go to bypass mode now. Don't understand what happened.I haven't used it in a few months. Went to check it on 6 meters which my antenna is a 1:5 and noticed on my extenal watt/SWR meter there was no output wattage. I put it in bypass and then had wattage and good SWRs. Guess I'll have to wait tilll I get money to send it off. I never had problems before that.

Frank,

I'm using a SG-239 with my FT-897D for 2 years now.
I've bought a suitable plastic electric wiring distribution box
for it for better protection as manual states. The operation is
quite good for such a cheap tuner. The remote tuner is matching
your antenna to your 50 Ohm coax instead of table-top tuners,
which match a complex system of antenna+coax which may reduce
overall efficiency. I'll buy a SG-237 for portable use.
I think it's similar to SG-239.

These SGC tuners have some drawbacks too:

1) Overjumping the best match. Sometimes when you clearly see
it matched nearly 1:1 it jump over to 1:1.3
2) Random retune while in transmit. (Use Smartlock device.)
3) Has no 100 Ohm load attached at the input while tuning (like
in military or marine tuners) which lead to ALC spikes.

I use an AT-897 on my FT897D and love it. It tunes whatever I throw at it and is as portable as the rest of the radio. However, in my mobile, I use a sg-237 to feed a 108" whip. The mobile radio is an IC7000. (sorry- the 897 just doesn't cut it as a mobile, I tried) The tuner is bolted to the back door. I drilled through the door to run the feedline to the whip. The only issue I had was finding wire that wouldn't arc and short out. Third time was a charm. No issues since. The 9' whip tunes 6M-80M. I can park, open the back door and swap the whip feedline for an insulated wire, toss the other end into tree and work 160M as well. For the mobile it is great. Just pick a frequency and start talking. The 237 tunes. No fuss, no distractions from the road or trail.

29126. Charging

Yahoo group: FT897 (2010)
Date: 2010-02-13 12:05:00 UTC
From: josedouglas@yahoo.com
Topic: 29126 Message: 29126

Hi all!

We don't have the internal batteries in our rig.
What we do for emergency power is connect the radio to a deep cycle marine battery.
The battery is charged with three 15watt solar panels (total of 45watts) coupled to a 7amp charge controller.
Solar kit was $200 at e-pay and included a (cheap) 400 watt inverter.
We only use the Solar Panels when we have no power, rest of the time we trickle charge our batteries with a Craftsman car battery charger.
I haven't had to use the Yaesu on emergency power yet, but I have run a 2metre Kenwood we have for more than 6 hours
running APRS with negligible battery discharge, voltage holding at 12.42 volts.

The amount of time you get out of a battery obviously depends on how much transmit as opposed to receive.

Hope that helps.

I have an 897D , but only use as a base for now , when $$ allows , I plan on buying most of the accessories [but mostly will be 3rd party , w4rt web site] .
And I am very familiar with solar .
I have not seen a turn key solar charger meant for the Yaesu , a few issues would be , that the batteries system as all parties sell them are set up for a detected AC charger .
With solar , you need a charge controller , then you need a charge controller for each type of battery , some charge controllers are programable for many types of batteries .
So having all the details of each component , an especially the battery being used , then charging & discharging as manufacture recommends , to get maximum life out of the battery .
You will want to shop for the components with what the charge requirements of the batteries are , volts 13.8 - 16 , I do not remember the mili-amps - a charger controller & panel that will provide that .
With the batteries being over $100 each , it is important do do correctly .

The w4rt OFC takes DC, it comes with a transformer to convert AC to DC
but it has some intent to be connected to solar. Their website even
talks about that.

The biggest issue I have seen is that they want 26v from the solar
array, which is a bit odd given the way most panels are configured when
you purchase them. They do include an extra connector to make it easier
to connect to your solar array.

What I had considered doing was making a more generic output, for
example a lm7805 and a usb adapter, a lm7812 and a cigarette lighter
adapter, etc. That way the solar system is more generic and capable of
charging a variety of items.

I have an 897D with the yaesu batteries and charger. The Yaesu charger is a DC charger with 2 input connectors a 12v and 24v. The 12v uses the power cord for the radio(6 pin) and the 24v uses a wall wart type connector. I don't have it in front of me but I think it requires 1.2amps for 24v and 2.3amps for 12 volt. You should be able to connect a 30 watt or larger panel to this charger. That said, if you plan on using the other battery while charging the other, you will need to make some changes to the charger. I found that 17meters was pretty useless while using the charger and 20 meters was pretty bad too. I added some caps to the charger output and put a couple of ferrite beads on the cord and this cleaned up the issues I was having.

In the end I just gave up on the internal batteries and just use SLA's now as I could never get much life from the internal batteries and they self discharge pretty fast if your not using them often.

The RT system software is like a spreadsheet. You enter or change values as needed. HRD lets you change those values on the fly and they are saved. The beauty of RTS is that you can set up your radio for a base station and then save those values and then set it up as a mobile station (power levels repeaters etc) to load when you want to use it that way. Of course you'll always need a computer either way.

Maybe someday the radios will have a USB port and will be able to read such files from a flash drive. (You heard it first!)

RT only lets you program the radio.

For the adventurous you can write your own software. This would be able to do everything that you want it to, in the way that you want it to. I have a perl module that makes this a little easier, to do the memories you need to know where in memory to write, I have a partial memory map, which could use some help :)

Its all free if someone wants to write something I would appreciate hearing about it.

Yes checked that first.
The first indication happened after I used a mic with a preamp built in so I believe some how I damaged the internal mic preamp in the 897.

Please read my original post before you reply. Some of you did not
read it before you replied:

1. The $640 INCLUDES shipping.

2. This radio is NOT used. It is NIB = New In Box. The owner stated he
never opened the box because he won it at a raffle and already owns an
857D.

Unfortunately, the owner only has one of these deals for sale and I
already bought it. FYI, I found this deal on eHam's classified ads.
I'm sure more similar deals will pop up from time to time.
Keep your eyes peeled. I also saw 857Ds for sale very recently on
QRZ and craigslist.

ALSO, before I bought this one, I had been watching 2 used 857Ds on
ebay. Bidding for the first one will end on the 16th. Good luck!

I sincerely thank all of you for your speedy replies. Next on my
shopping list: auto tuner.

29145. Power Settings FT897D

Yahoo group: FT897 (2010)
Date: 2010-02-16 09:23:41 UTC
From: on7cl_rudi
Topic: 29145 Message: 29145

Hello FM,

The minimum power you can get on a FT897D is 5w if I'm not mistaken.

I need to set my FT897D to +- 2.5 watt to drive my HF amplifer.

Anyone knows how to do it and what settings I need ? (Probably it has something to do with the hidden menu.

All info is welcome.

Best 73 - Rudi - ON7Cl / KB8TAB.

From: kc3vo@aol.com
Topic: 29146 Message: 29146

If your amp only requires 2.5 watts HF drive, I wonder if it is really an amplifier that is LEGAL for HF HAM use? If it is solid-state, does it have at least SIX separate bandpass/harmonic filters, and how are they switched? (What you described leads me to believe you might have a cheap "CB radio/27 mhz" type device, which is generally designed with ONE purpose in mind, HIGH OUTPUT POWER, without regard to harmonic or spurious radiation on other frequencies!) Such amplifiers can "Sound Good" on the band they are operating on, but they simultaneously will transmit/emit signals on many higher frequencies that are harmonically related, possibly causing unintended interference on those frequencies, some of which are used for AIRCRAFT, broadcast, other ham bands, and public service communications. Such unfiltered devices should NOT be used on the ham bands ANYWHERE, and are ILLEGAL in the U.S.A.-Hopefully you are NOT using such junk, but all amateurs should be AWARE of this. An attenuator pad, having 3db or greater attenuation, can be installed into your amplifier, between its input relay and the amplifiers drive input terminals-this pad should be built with resistors rated at 2.5 watts or better, and will allow you to safely drive it with 5 watts. (A 10 db attenuator pad would permit using 25 watts) See a good ham technical book, such as the ARRL HANDBOOK, for the technical details if you are lacking the knowledge to build one.--73, KC3VO, Bob Curry

Rudi,

See message # 21368 for the procedure used to reduce the low power setting below 5 watts. This has been done by many to comply with QRP contest requirements and to drive transverters.

> All info is welcome.

You cannot reduce the power, even to 5 watts. You will find that the
output spikes at much higher output before the ALC kicks in,
so you will overdrive your PA and possibly do damage to it.
I'd investigate an attenuator.

If your PA delivers 250W out, then it has 20dB power gain.
If it has an output of 1 kW, you'll have a gain of 26dB, which
is rather a lot for a single stage. Chances are the PA has multiple
stages, in that case I'd consider removing one stage in the PA,
it will need more input then and is probably a better match.

There is no "hidden menu", only a *service menu*, intended to adjust-out
spreads in component values. The ALC circuit isn't perfect (it never is,
so this isn't Yaesu's fault), and it was designed to be aligned
according to specs. The output range is not a user setting,
it is a design parameter. If you want to change it, you probably need
to change the ALC circuitry as well as you will need to change the
control loop - not simple.

Note that the driver stage (main board - red coax to the bottom PA board)
runs an output of, typically 2-8 Watts, depending on the gain of the
finals on the PA board. You could consider picking the RF there, but
note it's unfiltered and has no protection at all, and you circumvent
the ALC circuiry, so be careful.

Frankly, I'd consider a PA with a better matching input level.

Subject: [FT897] Power Settings FT897D

Hello FM,

The minimum power you can get on a FT897D is 5w if I'm not mistaken.

I need to set my FT897D to +- 2.5 watt to drive my HF amplifer.

Anyone knows how to do it and what settings I need ? (Probably it has something to do with the hidden menu.

All info is welcome.

Best 73 - Rudi - ON7Cl / KB8TAB.

Rudi,

I would be careful reducing the output by winding up the ALC. Although I have not experienced it (I do not use the 897 in such ways) the 897 has a reputation for generating a high power RF spike on keying up. I believe it is caused by the lack of ALC rise time.

If I wanted to reduce the output to 2.5W, I would use an attenuator of a suitable rating, of between 13 and 16dB in the output circuit.

Geoff

From: w9wtf
Topic: 29151 Message: 29151

Hello all.
I have just purchased a Yaesu FL-2100 amplifier and would like some advice before I hook it up so that I don't make a mistake. My setup is:
FT-897 with LDG AT-897 tuner to an URM-120 wattmeter. Since the AT-897 already uses the CAT/LINEAR port, and the ACC jack, how do I set this up? The manual doesn't give me enough information to be confident in setting this up correctly.
Thank you for your help in advance.

Rudi,

I agree with Geert and Geoff. Try using an attenuator. I blew out the diode in my homebrew QRP power meter several times before I figured out what was going on. The power setting scales are fairly accurate on the FT-897D but at low power settings there is an occassional leading edge spike of much greater power output.

29154. Yamaha CM500 headset with boom mic, trouble with noise on mic

Yahoo group: FT897 (2010)
Date: 2010-02-16 22:40:25 UTC
From: prybry
Topic: 29154 Message: 29154

I just picked up a set of Yamaha CM500 head phones with boom mic...
I've got the mic working but huge problem with noise, it sounds like electrical back ground noise, it changes as I move the 9ft long headset wire around. Could the shield on the cable not be enough? How do I tie the shield to the chasy ground?

Anyone else have experiance with this type of headset?
Or connecting a computer style head set to a FT897?

According to the Yamaha web site it has a 600 ohm dynamic mic and the 897 is also looking for a 600 ohm dynamic mic. The mic works, it's just the back ground noise is so high it's drownding my voice out.

The headset works great otherwise, excellent sound quality in the head phones.

I'm also tied to the radio through a Heil Yaesu adapter, I checked the pin outs with a meter and all seems fine... the PTT button I built works fine. I didn't use a sheilded cable for the PPT could that be an issue?

Help...

If you can not find someone to talk to, change the meter settings to measure power out. If you are getting power out and no SWR this is a good thing.

Topic: 29146 Message: 29157

Hello FM,

Thanks all for the answers.

I don't understand why several people start thinking of using a ILLEGAL CB amplifier, I wonder why I should do that, I know it's hard to get a ham license and I don't play with those things because I don't want to get rid of my license. I don't see what CB has to do with this !! most of us are comming from CB so whats wrong about that ??

The amplifer I'm using is a LEGAL ONE here in EU and also in the US, it's an SPE EXPERT 1K-FA, with 2.5 watt input I get +- 200w out thats enough to make regular qso's or not, 1kw is only need to get true a pile up for a new one (expedition) or so.

Just wanted to put things clear and I will think twice in the future before putting some messsage in this forum.

Once again thanks to all for the info.

Bob and All,

I couldn't find the genesis of this thread, so I'm probably missing the basic facts. However, your post infers that the low drive power is a violation. I think that rule was dropped some time ago--at least here in the U.S. There are lots of amps out there that require very little drive power, but were purposely inhibited so that it would take higher drive power to attain full output. There are also a lot of CB type amps that were not legal (at one time anyway), and also had inadequate bandpass filtering. For example, some lines produced by RM Italy were that way, but their "HLA" series does have required bandpass filtering I believe. Those amps only require 5 watts or so to attain 150 watts or more, depending on which version you have. Also, I suspect that minimum drive requirement wasn't universal, so it wasn't a problem in many foreign countries.

Rudi,

I am a member of several Yahoo Groups relative to Ham Radio. One thing I find that they all have in common. It seems that when someone posts a questions there are two groups of people who reply. On group is composed of those who offer good information and try to help answer the question. The second group are those who want to show off how much they know and get off onto a dozen tangents about all sorts of things rather than just answer the question. I don't think most of them intend to be offensive (although a few just seem to want to argue about everything.)

Anyway I just hope that you won't put all of us in the same bucket. A lot of us remember someone who was an Elmer and answered all of our questions while we were learning. I remember some of mine were pretty dumb inretrospect, but my Elmer never made me feel dumb - he just helped me learn.

Regards and good luck solving your problem.

73,
Mike, AE8U

I have a similar problem.

Is the fuse on the top side of the board, that is, visible by just removing the top cover of the radio, or do you have to get to the underside of the board by removing the screws to the board itself.

My Cat cable (RS232 to USB) works fine with HRD, but the 12 volts is no longer available and the transistor seems to be shorted. Not sure where exactly on the board that is either?

Subject: [SolidCpyCW] NAQCC - Lifetime membership is FREE!!
To: SolidCpyCW@yahoogroups.com

Want to break out of the dull winter routine?

Want to be part of the largest QRP CW club in the world? (4,000+ members from 80+ countries!)

Perhaps you are looking for someone to "Elmer" you? Then we have just what you need to develop and improve your CW skills, including QRS nets perfect for the new CW op.

Or maybe you would like to volunteer your time and become an "Elmer" to help one of those fellow hams new to Morse code.

And how about a Sprint or two thrown in for good measure? We have them too, for those of you who like a little friendly contesting. Our sprints now rival many others in the amount of participation.

Want something that lasts a little longer than a sprint? We have challenges that last a whole month with a different theme each month.

Into awards? Our extensive awards program has something for everyone.

Many of our sprints, challenges, awards, and other club activities involve handsome prizes donated by our members.

Best of all, this and more can be yours at NO COST just by joining the NAQCC (North American QRP CW Club). Lifetime membership is FREE!!

As different as we may be, we all share one thing in common, and that is our love for CW.

Now is the time to get involved! Join our group that includes "Big Gun" contesters, hard-core QRPers, experimenters, ragchewers and SWLers; young and old alike. We welcome all who want to help support CW and have at least some interest in using QRP from time-to-time.

Help us on our mission to preserve and encourage CW activity on our amateur bands. Sign up today and help keep CW alive and well.

Don't wait, do it now!

Visit http://home.windstream.net/yoel/ to sign up and receive your
FREE lifetime membership number and certificate.

On behalf of:
Tom, WY3H - NAQCC President
John, K3WWP - NAQCC Vice President
Paul, KD2MX - NAQCC Recruitment Officer
Dave, VA3RJ/VE3JDR - NAQCC Publicity Officer

Gordon,

I am in a living situation very similar to yours. Which model of tuner
do you prefer? Do you ever operate from your roof or fire escape?
What do you do for grounds?

29170. Severely truncated first element in QSK CW

Yahoo group: FT897 (2010)
Date: 2010-02-17 00:08:26 UTC
From: n0ss
Topic: 29170 Message: 29170

I am writing this note of behalf of a fairly newly licensed operator who owns a 6-month old FT-897 and who is experiencing PERIODIC severe truncation of the first element sent when in QSK mode.

We did some on-the-air testing. On 40M (7080 kHz), if the operator sent the character "I" in CW at about 15 WPM, the entire character appeared to effectively be a perfectly-formed CW "I"... no element truncation was noted.

Moving to 80M (3585 kHz), and again sending the character "I", the first DIT of the "I" was shortened to about 10%-20% of the expected DIT length. The second DIT was sent at full length. Likewise a leading DAH would be truncated to a much shorter element as well.

Moving to 20M (14030kHz), the same leading element truncation was noted on the first DIT of an "I", and on DAHs, but to a lesser extent (e.g. a leading DAH was probably 60%-70% generated).

Moving to 15M (21030 kHz), NO TRUNCATION was noted on any element sent.

We finally went to 10M (28030 kHz) and again found that the leading element was being severely truncated.

We stopped for a couple minutes, discussed the problem over the phone, and I asked the operator to send some more characters so I could create a WAV file for further analysis. THIS TIME, and without the operator changing anything on the FT-897, there was NO TRUNCATION of leading elements, on the same band and only 3 minutes following tests which DID produce truncation.

We then went back down the bands, testing... NO further truncation was noted from the FT-897 on ANY band...!!! And we have not been able to reproduce the effect... at least during additional testing today.

This was NOT an isolated problem. The operator has previously received similar reports of element truncation (though all on the 80M band). But as of this writing, we have not been able to reliably reproduce the problem.

Unfortunately, I am not familiar with the architecture of the FT-897, so I am quite hesitant to try to hypothesize about the cause of this problem. I do know that some rigs have experienced problems (and sometimes ONLY on specific frequencies) with slow PLL lock-up or transition, thus causing similar problems, or at least problems which might appear to be similar.

Has anyone else experienced this problem or is aware of the problem? If so, what can you tell us about it. Before we go to Yaesu with the problem it would be very helpful to be able to know how to reliably force the problem to occur, so Yaesu can find/fix it. If they can't see it occur, there'll be little effort made to fix something they can't see.

Thanks for your time.

73,

Tom Hammond N0SS

Blaine,

I used the Heil AD-1-YM with mine.... I had to cut the plug off the CM500 mic wire and put on a mono plug...
The weird thing I found when I took the plug off the headset was, there is only two leads inside the cable, the shield and the center mic wire...
even though the plug is a stereo plug (3 contacts)? The tip and center ring on the plug was tied together...

I'm not sure why it didn't work with the heil adapter with the stereo plug, but it wouldn't make contact.

The headset is sweet... I just wish it worked right out of the box...
I look forward to hearing if you have better luck... I'm still fighting a noise issue.

Does it come with the power supply [the wall wart for charger] not in your list ?
Then knowing the condition of the batteries , is a big deal , that means a test , not what you think of them .
I did not check the highest prices but new discounts , a quick check for 2 batt. quick charge & PS is from 256 .38 - 449.80 , that is Yaesu and or W4RT - which seems like there are better reports from W4RT's stuff , then used , usually - at least 20% to 50% , and batteries are still a big question ?
So 1st off more info to gauge the value .
Next for some like my self , who may be interested , is name your price , as mentioned earlier auctions , well I drop out when the price gets high .
I never make offers , even an auctions , I watch the biding , I know what I have to spend , and the value of what I'm looking at .
So the lowest of the the above figures is 50% = $128.19

29178. wrong "mode" adding log entry on HRD

Yahoo group: FT897 (2010)
Date: 2010-02-19 00:58:51 UTC
From: iz0inx
Topic: 29178 Message: 29178

I'm using the last released version 4 of HAM Radio Deluxe (4.1 build 2321) with my ft897 and everything works fine but the reading of the "mode" in the "Add Logbook Entry" window.

All the modes are correctly read with two exceptions: DIG, which is read as USB and CW, which is read as TOR.

I believe it depends on what the rig is sending to HRD, anyway, does someone know if there is some way to manage this?

I could understand sending USB instead of DIG, actually my PSK31 emission is USB, but why TOR instead of CW ?

Cheers, Fil IZØINX

29180. Power on fault

Yahoo group: FT897 (2010)
Date: 2010-02-18 16:52:52 UTC
From: M3WBS
Topic: 29180 Message: 29180

Hi All
I have two FT-897D's, both are kept in the same outside building/shack. I am wondering if I have a fault with one the radios or if it is due to low temeratures or maybe humidity.

Sometimes after a frosty night one of my two 897's wont power up correctly, the display flashes briefly and comes up with no backlight and there is a low level hiss from the speaker. No controls function while in this condition. After a few power off and back on tries the radio powers up but resets the CPU so I have to go all through the settings again to get it back to where it was. It will then work fine.

Does temperature cause this problem? It never drops below 3 deg C in the shack becuase I have frost protection heating on 24/7, I must add on a night when its been mild outside I have no problems with it.
Anyone else had this happen?
Regards
Steve

29181. thank you all for your 857D tuner and other help

Yahoo group: FT897 (2010)
Date: 2010-02-19 01:25:30 UTC
From: ZephyrNYC
Topic: 29181 Message: 29181

Thanks to everyone for your awesome responses, advice, and tips. I'm still deciding on an auto tuner for an 857D. I'll hold out a little longer, hopefully to find a good deal (and save up a little more money). Right now, I really like the LDG Z-11 Pro II and YT-100, and SGC SG-237. I also heard about the LDG AT-100 Pro II coming out soon.

This is how I plan to operate on 160m through 6m (and of course 2m and 70cm):

approximately 50% of the time:
from the home shack on the roof or metal fire escape on the 7th and top floor of an apartment building with a dipole or other stealth wire, fishing pole, or other portable antenna,

49%:
pedestrian mobile with a fishing pole or other portable antenna,

1%:
vehicular mobile later down the road.

Do the LDG tuners have to be located at the transceiver? Can they not be operated at the antenna feed point (more desirable for efficiency)? Can the SG-237 and other SGC tuners only be operated at the antenna feed point (less desirable)?

73,
Frank

Thanks for the information Dave. Power supply is in good working order. My other FT-897 (D version) is inline with the 35amp power supply too and I experienced no problems. Anyway, I replaced the older '897 with a new '897D on Thursday and kept it on the air for a couple of hours Friday evening and all is good. I did send the AF Problem '897 to Yaesu after speaking with one of the tech guys. Thanks again for advice.

29195. Noise

Yahoo group: FT897 (2010)
Date: 2010-02-21 18:50:40 UTC
From: bragucci
Topic: 29195 Message: 29195

I replaced my Kenwood TS820 with the FT-897D. I never had a "noise" problem on the 820. The 897 however is a different story. When the furnace clicks on I get S7 noise, the refrig causes the same thing, dishwasher, you name it, if it has a motor I get S7 noise. I moved the 897 to other outlets in the house, same thing. My house is older and my outlets are NOT grounded, they are two wires. I suspect this is the problem ? How best to ground and see if this helps? The ideal solution would be to have a rewire job thru out the house but we can't do this right now, $$$. Would a ground rod placed outside the house with a wire from it to say the antenna tuner provide a good ground?
Any ideas would help.
Thx
Bart

I am curious if you are using the same power supply for both radios. It could be the power supply that is picking up the noise and sending it to the radio.

Then again you could have RF gain turned up really high and that is picking up something that the kenwood didnt. I know that if its on SQL for FM and I goto HF I have to switch it to RF Gain and turn it down a bit because the noise level is high, but that seemed normal to me.

I personally put some ferrite chokes on the power leads that go into the radio, I also do not have any noise. I have used a hacked apart computer power supply and a astron RS35. Granted I have not compared noise readings on battery vs wall current, I have not used other radios to compare the same frequency at the same time with the same antenna etc. So I really dont know.

As for grounding I made a ground bus (copper pipe with ground strap attached by hose clamps) which goes to its own ground just outside. This seems to work for me, when I connect it to the ground screw on the radio it seems to help somewhat. I mounted the pipe onto a board, painted it black, used silver clamps to mount it to the board with brass screws so it looks pretty (contrast of colors looks nice).

An 8 foot copper clad steel grounding rod from lowes, 1 foot of copper pipe with end caps, clamps, screws, etc has a total cost of $20 or less, so it isnt a bad deal and seems to work fairly well. If you have rocky soil like I do you may have to cut the rod into 2-3 parts and drive them separately and bridge them with wire attached with grounding clamps.

To get the wires into the garage where I have my radios set up I just drilled a 1 1/4 inch hole and put some pvc in with weather hats on each end and stuffed insulation in the pipe. This gives me the ability to run easily 6 antenna wires and 1 ground strap through without crowding

and it keeps the rain and cold out. In a pinch I can probably run 9
antenna wires, but I do not have that many antennas (yet) so it does not
matter :) I sealed that pvc conduit with "great stuff" spray foam. The
total cost was under $10.

Howdy,

By any chance did you unplug the antenna cable from the back of the set? If you did and you still hear the noise, you will have to send it in to have the filters replaced.

Hello Bret

Hope you are enjoying your FT897D,

Just a comment on the spray foam you use to fill the gap in the PVC pipe ! !

Polystyrene foam is not recommended near PVC piping or cables, it can degrade the PVC over time,,, that is the [white] foam which is used as a spray / pumped filler for brick cavity walls,,, or the polystyrene sheet which is used as insulation in walls and floors.

There is a good resin based spray foam available in cans which sets like a honeycomb, and is safe with PVC pipe and cable,,, it is manufactured for filling around PVC window and door frames ,wicked stuff to get off your hands,,, and must be used 100% once opened.

Regarding the rocky ground where you want to sink the earth spike,,,

There is an attachment for an electric demolition hammer,,, [a step up from a hammer drill] ... you hammer in the spike about 6 inches with a hammer,,, and then use the electric "hammer" to drive [vibrate] the spike down to its full depth, in one long piece. You could borrow one from your friendly plumber or electrician .,,, [or hire by the hour from your nearest tool hire shop]. depending on the diameter of the spike, you may need an adapter. you can also hire a masonry drill up to 5 feet long from your local hire shop.

This is seemingly not common knowledge outside the electrical trade.

73 _______ Peter EI4HX ei4hxperimental@...

PS. have you electrical continuity between the black painted pipe,,,, and the silver clamps ???

No one in this county rents them, and paying someone to come out and
drive it is cost prohibitive. What I did by cutting it is documented in
ARRL books, and generally works well. The same surface area is in the
ground, the only difference is what is used to bridge the rods together.

Rudi,

A three dB attenuator will cut you power in half. Making your 5W output a 2.5W output. I have never seen a pre-made PL259 attenuator. You could use resistors and build one, or use adapters to transform a N style attenuator. In purchasing or fabricating I would look for something capable of handling 10W

Bart:
The 897 is the first radio I ever owned where I can say the reciever IF has too much gain. In menu MFm, turn your IPO to on, this cuts off the first reciever preamp. I use IPO on 20-160 meters. I find this to cut down the noise while helping signals pop out from the existing noise. S-meter readings seem to be more normal as well.

Well, I appreciate everyones help. I have used ALL the suggestions and have some improvement. From the responses I gather that noise is just something that comes with this particular radio and I'll need to "play" with settings to try and minimize it.
Thanks everyone, and if anyone else has any other ideas I'm always open.

Bart

I would try powering with a battery and hooking to a dummy load. If you have no noise then hook to your p/s and see if you have noise. Then to your antenna. Basically a rule out game. Remember if you introduce a ground to your radio ONLY be careful not to touch any other conductive appliances connected to ungrounded outlets. In the end providing grounded outlets is best.

In my opinion if a battery has been in general use for two years or more then its best to avoid them or make sure you are paying a price that won't bother you if you only get another 6 months of use. Not knowing how the battery was treated is of course the crap shoot and your level of uncertainty will be reflected in your decreasing purchase point.

If you are depending on those batteries for routine use, I think its best to buy them new, if for only emergencies then something used may be a better fit. Although some might argue the reveres. Not much help huh?

Have you tried turning on the IPO? The preamp in the FT897 does seem to be kind of noisy, and is unneeded on HF as the rig is plenty sensitive there as it is. I turn on the IPO and I see a S6 noise level go to nothing.

29214. Software Mars mod

Yahoo group: FT897 (2010)
Date: 2010-02-20 02:30:55 UTC
From: John Geiger
Topic: 29214 Message: 29214

I just purchased a used FT897 and I think it has had the software MARS mod done since the automatic repeater shift doesn't work on it. Also, the 60m channels are no longer stored in memory. Does the software mod remove the 60 meter channels? And is there a way to undo the software mod without actually having the programming software-like a full reset or something like that?

a mars/cap mod, often incorrectly referred to as "freeband", will remove
60m and the repeater shift. You have to manually enter the 60m
frequencies and set the shift to what you want.

The mod does not matter if its hardware or software, if its software a
reset of the radio will remove it since that causes memory locations
00:04-00:05 to reflect the actual jumper state.

The software mod does not work on newer radios, I do not know when it
changed yet.

Hi Wayne
I use an Adnois AM-508 on both of my 897D's. It has the advantage of being switchable on the bottom for FM or SSB. The Adnois on both radios always gets good reports on FM & SSB. And you have the advantage of being able to buy different leads for different radios, so you can use it ont he 897D or on just about any other radio in the shack.
I cant compare the Adnois to the MD-100 myself as I have never tried one, but I have heard a couple of reports that the MD-100 isn't too good on FM, it may be just a case of setting the MD-100 correctly, maybe other members can comment?

From: Hank
Topic: 29215 Message: 29218

A few months ago, I bought an MD-100A8X for my FT-897D, and my opinion is mixed. On FM, it sounds great. I have the mic gain set at 35%, and have tweaked the settings with our local repeater group as my ears.

On SSB, it doesn't provide much drive at all. I have my mic gain set at 90%, and it's as if I don't have a mic plugged in at all. So when I get on HF, I have to switch back to my handheld that came with it. With the handheld mic, my mic is set to 50%, and I can easily make contacts.

At the Orlando Hamcation a few weeks ago, I talked to a few people who have had the same experience, and 1 even sent it in for repair, and when he received it back, had the same results.

I chose the MD-100 over the Heil GM-5 to save money, but it looks like it was not the right choice for me. I am now looking to just spend the money and buy the Heil GM-5.

hth,

Hank / KB4MTO

Bart, et al,

I have found that if I use the ATT setting instead of the IPO setting in menu MFm, my noise drops to almost nothing and the incoming signal is clear and very easy to copy. This works great for me on 20-80 meters.

29222. Re: Software Mars mod

Yahoo group: FT897 (2010)
Date: 2010-02-24 00:15:40 UTC
From: NM7L
Topic: 29214 Message: 29222

As I recall the software mod functioned on the earliest lots of the "D" model. It was at the behest of the FCC that Yaesu disabled any software modification capability: MARS mods after this point were only available via bridging the solder pads internally.

Which brings up the question to John (AA5JG): If what you have is a FT-897 model then 60m channels weren't available and naturally, you would not find them in memory! However, if what you have is a "D" model then yes, 60m channels would be disabled in memory along with disabling the auto repeater offset.

29227. ATAS/FC30/FC40 protocol

Yahoo group: FT897 (2010)
Date: 2010-02-23 15:30:55 UTC
From: pakjan830
Topic: 29227 Message: 29227

Hi all,

I use my FT897D with a SGC239 autotuner into a random wire antenna occasionally and am very happy with the setup. I tune it by switching the radio to AM mode and transmitting an unmodulated carrier (at 25W) until the tuner locks in.

Of course I would prefer to initiate the tuning sequence with the tune button, same as with the ATAS or FC30. From what I can see the communication between the FC30 and the 897 happens via the CAT port which of course is less than desirable as I need that for other purposes. Anyway, for further analysis I would like to understand if anyone has ever taken the time to analyze the serial protocol between tuner (or ATAS) and rig and has documented it?

73 de Jan

29228. Favorite mic for the 897D

Yahoo group: FT897 (2010)

From: Sean and Lanie
Topic: 29228 Message: 29228

How do the Heil mics perform on this rig?
Thanks!

29229. Re: Noise

Yahoo group: FT897 (2010)
Date: 2010-02-23 10:23:20 UTC
From: gretske
Topic: 29195 Message: 29229

I have an FT897D and a TS-940. While both of them had a high noise level, the 897 could not hear at all, where the 940 could, if I cut in the attenuator. After methodically turning off the breakers in the house one at a time, I found a Ryobi charger that was putting out more RF than VoA!

I now leave it unplugged except when charging, but it was interesting that the RF hash affected the 897 far more than it did the 940. And, the 897 has all those fancy DSPs, etc. that are supposed to help it with noise. I think the front end is easily swamped. Cutting in the IPO does not work, because it is after the suspect front end. The 940 has an attenuator before the preamp, which the 897 does not.

DE N7UVL,
Noise can get in and affect Radios differently. AC Line; RF via
antenna input; AC/RF via other lines that have access past
the chassis shielding; Un-terminated chassis connectors
are a few.
-DSP's work on the audio presentations and are usually
adjustable for individuals hearing/mind computations.
They are not a catch-all. DSP settings for one person may
not work for another person.
-Some chargers can create both AC line noise and RF noise./ga

The Heil mic is GREAT on my 897 and 817. Very big difference between that and stock mic. I even have an adapter for the "Heil Traveler" headset to use on my FT7 hand held. You wont go wrong with them and the support system is also top notch.

It's not necessarily a "hack". It's very easy to "assume another identity" by simply changing the return information on your email client. There are measures that can be taken on the server end that are supposed to verify that the "return" address is really where the message came from, but they're cumbersome and not perfect. I have my account set that way, and I still will see from time to time a message that has my return on it that didn't come from me.

Just my observation.

Do I like the FT897D, yes overall I do. I like having the band coverage in one rig. Do I regret replacing my TS440SAT, yes. Why? Because the audio on the TS440SAT was much better, it rejected INMOD much better on 160 meters and it had less noise. Does the DSP work, in my opinion not much. Would I buy this rig again. NO! After an antenna the receiver's noise rejection is the next important factor to me now.

Topic: 29249 Message: 29249

I sure hope that not many people have to send their 897d into the Yaesu Service Center in California for service is it takes forever to get it done and get back to you !!! They do NOT communicate with you unless you keep calling them!!!!!!

I am an Official Observer here in Indiana and I can honestly say that Yaesu does NOT have the Quality that it used to have at all !!! I hope that Toyota has not bought a part share in the Yaesu Company as that would explain a lot when it comes to the loss of quality on these radios by Yaesu!

Jason,

The service manual for the FT-897 is also for the FT-897D according to Yaesu. The only thing that changed between the two models was software programming to add the new WARC bands.

From: Steve Yates
Topic: 29195 Message: 29253

I hope that you are using the IPO (pre-amp off), attenuator, and RF Gain to your advantage as the manual suggests. On 7 MHz and below I always have the attenuator on and the IPO is on (pre-amp off) until I get above 21 MHz at least. The rig has a lot of receiver gain in case you need it, like for a Beverage receive antenna. With normal antennas at lower frequencies you don't need all of the gain. Too much gain and all of the noise is compressed by the AGC to the same level as the desired signals and this will make the receiver seem "noisy".

When used properly I don't perceive any noise issues with my FT-897D. I agree with you somewhat about the audio DSP. The automatic notch filter is almost worthless. I've had it work only a little bit on rare circumstances. The DSP bandpass filter works great as long as you also use the RF Gain control to keep signals out of the DSP passband from "pumping" the AGC.

From: Risk
Topic: 22223 Message: 29254

Hi Mike, and Everyone,

Thanx for the post mate, as a matter of fact, Thomas DG8FBV just sent
me the details that I needed.

There is a difference between the two boards and the service manuals do reflect the new arrangements of the real estate.

In the new board (Lot 25+), Q1108 (2SD2211) is moved away from where it is on the first board, you may note Jumper J1027 is included in this iteration of the board also. R1529 is now on the board in the position where Q1108 maintained in earlier boards. In fact, Im still trying to locate it actually but its not important for me at this stage.

What I *thought* was the right fuse in fact was. The Fuse itself has the number *3* stamped on it. I had already noticed this, and compared it to the file in the group files section labelled FT-897 ACC Fuse Placement-1. I just wanted to be sure that that was exactly what I looked for. I already had an open circuit reading from my multimeter so it was a pretty good bet.

I just wanted to make sure before I correct it with a poly switch as I am about to sell it at a HAM Fest here in New South Wales Australia tomorrow.

So thankyou all for posting or emailing, I really appreciate it.

Cheers and 73's

29257. Final Reminder -- LIMARC Hamfest this Sunday, Feb 28th!!!

Yahoo group: FT897 (2010)
Date: 2010-02-27 01:42:26 UTC
From: ZephyrNYC
Topic: 29257 Message: 29257

Please share with other hams and groups:

Is anyone from the group going to attend the hamfest in Hicksville in Long Island, NY this Sunday the 28th? I MIGHT go if the weatherman's forecast of our nasty snow storm weather dissipating this weekend proves to be true. If so, I'll be shopping for an auto tuner and accessories for my first ever personal HF transceiver ;) Maybe I'll see ya there :)

73,
Frank

Subject: Final Reminder -- LIMARC Hamfest this Sunday, Feb 28th!!!
To: ZephyrNYC@...

I hope you're not exerting yourself too much as you dig out, but it should be worth it as the LIMARC Hamfest will be held this Sunday, February 28th. I have been informed that the vendors are all on board at that the facility will be ready for the event.

The annual LIMARC indoor winter hamfest will once again be held at Levittown Hall. Located at 201 Levittown Parkway in Hicksville, the hamfest includes the following vendors:
KJI Electronics, Advanced Sprecialties, Quicksilver, Radio Oasis, W and W Battery, Dave Schneider, Tak-Tenna, HES Radio, RCG Trading, AND MANY MORE!

Vendor setup begins at 7:00am and the doors open to the public at 9:00am. A VE session will begin at noon.

Card checking will be available at the ARRL table.

Talk-in on W2VL, 146.85 repeater (136.5 PL)
For more information, see the LIMARC web page at
http://www.limarc.org or E-mail: hamfest@...

I'll be at the ARRL table. Please stop by and say "Hi."

29258. Serial Numbers/Indicators for 60 Meter/TCXO Addition ?

Yahoo group: FT897 (2010)
Date: 2010-02-27 02:22:37 UTC
From: Chuck Williams
Topic: 29258 Message: 29258

Good Evening All,

I've been tracking some FT-897D's at auction. Can someone give me a reference for serial number codes/series that indicate production runs with the addition of the 60 meter and TCXO features?

Any caveats (beyond auction precautions/considerations) that should concern me with purchasing one of these units used?

Thanks In Advance & 73's,
Chuck, KJ4HBK

Copied from the files link on the left:

Simple breakdown of the Yaesu code is below:

Position 1 = year made
Position 2 = month made
C = January
D = February
E = March
F = April
G = May
H = June
I = July
J = August
K = September
L = October
M = November
N = December

Position 1 = last digit of the year in which the radio was produced
Position 2 = month made
Pos 3 &/or 4 = lot number(s)
Pos 5<-8 = sequence in that lot

Example - My FT897D 4H370xxx would translate to:

4 = 2004
H = June
37 = Lot number 37

Thanks for the post. I'm receiving the emails through my mail client so don't have the "files" link you mentioned, though I certainly should have gone to the group's site and looked first. I apologize.

I will do so now, but the second part of my question was regarding the date the 60 meter & TCXO features were added to the 897D. Maybe that's in the file section as well. I'll certainly look.

I have to agree with your comments 100%!

I have never found a specific noise problem with the 897 compared to any other receiver.

However, as you say the rx does have a lot of gain and the S meter is pretty useless and very non-linear, and it is I think those facts that leads people to believe there is a high noise floor.

The other factor that seems to make a differene is the bandwidth of the audio without the DSP filter turned on and set up correctly. It is quite high and can pass high frequency noise whith can sound different to some other receivers.

Another factor can also the the actual setup of the sideband offset frequency. There can be a noticeable difference in quality when swutching between USB and LSB. Try this on an AM broadcast station.
Using the IF shift function can result in a noticeable improvement in quality. This problem can be corrected by setting up the sideband offset frequencies correctly.

I truly believe this to be true. My 897D is my third HF rig, but my first digital one. When I first got my 897, I was worried that it might be bad or very noisy. Then on field day, I took it to our location which was way out in the boonies on a horse farm. I hooked the radio up to an inverted-v, and there was absolutely nothing but signals. There was no noise at all, and signals were booming in. My home antenna is a 19' dipole in the attic, and I am in an adjoined townhouse, so can you say compromised noise maker?

Since then, I have been working with the settings in the rig. I started using the attenuator on most HF bands except 17. The biggest problem I have been dealing with is not knowing how to set up and use the DSP settings. I keep tweeking them and it seems to get better, but I would love to see some type of DSP guide or what others have their various dsp settings set to. Then I could compare my settings with those of others who know more about using dsp.

I have also been finding and eliminating sources of noise in the house, and have dropped my noise floor quite a bit. I love my 897.

From: Bart Ragucci
Topic: 29195 Message: 29263

I have started using the ATT as well, I see you can't have the IPO and ATT on at the same time, it's one or the other. In my case the ATT does cut noise down from the S8 level to a S3. BUT I think it's at the cost of incoming signal strength. I turn on the ATT and the person I'm talking to drops down to just above the noise level. What frustrates me is I always have to tweak the settings to tone down the noise. If I'm listening to 40m and have tweaked down the noise, then jump over to 20m I again have to tweak down the noise. I don't regret buying it, but would I buy another one, no. As for the DSP, I really don't see much of an improvement using the three choices. Again, I just got used to what I had, TS-820. But I thought with the new technology of the FT-897 I'd be in tall cotton with all the bands and settings and the like, but I guess not.
Thanks
Bart

From: jerry_lefever
Topic: 29195 Message: 29264

Hi
I too agree with the comments about noise and the FT897D. I have one with the built in PSU. It's nice to have it all in one box. I bought it to replace my FT990AC. I also have the FT857D too. On the bench test between them all compared to my Alinco DX70TH, results in the 897 and 857 being noticeably noisier in comparison on all modes. I have read many forums and threads on the noise, and set the IPO to off (or on depending which way you read it), and set the LSB/USB passband settings to make it sound right. On SSB the DX70 is better all rounder both on TX and RX. The FT990AC is good too by comparison, although a bit long in the tooth and big. When the chips are down and I am copying a weak signals on SSB, I would have the DX70 any day.
I want something that is all in one box . . . PSU, ATU etc, and there are not many on the market. The IC7700 is one of a few available.
Regards
Jerry G4CAZ

LSB/USB passband settings - what do they do? Would they reduce noise?
----- Original Message -----

Subject: [FT897] Re: Noise

Hi
I too agree with the comments about noise and the FT897D. I have one with the built in PSU. It's nice to have it all in one box. I bought it to replace my FT990AC. I also have the FT857D too. On the bench test between them all compared to my Alinco DX70TH, results in the 897 and 857 being noticeably noisier in comparison on all modes. I have read many forums and threads on the noise, and set the IPO to off (or on depending which way you read it), and set the LSB/USB passband settings to make it sound right. On SSB the DX70 is better all rounder both on TX and RX. The FT990AC is good too by comparison, although a bit long in the tooth and big. When the chips are down and I am copying a weak signals on SSB, I would have the DX70 any day.
I want something that is all in one box . . . PSU, ATU etc, and there are not many on the market. The IC7700 is one of a few available.
Regards
Jerry G4CAZ

>
> I have to agree with your comments 100%!
>
> I have never found a specific noise problem with the 897 compared to any other receiver.
>
> However, as you say the rx does have a lot of gain and the S meter is pretty useless and very non-linear, and it is I think those facts that leads people to believe there is a high noise floor.
>
> The other factor that seems to make a differene is the bandwidth of the audio without the DSP filter turned on and set up correctly. It is quite high and can pass high frequency noise whith can sound different to some other receivers.
>
> Another factor can also the the actual setup of the sideband offset frequency. There can be a noticeable difference in quality when swutching between USB and LSB. Try this on an AM broadcast station.
> Using the IF shift function can result in a noticeable improvement in quality. This problem can be corrected by setting up the sideband offset frequencies correctly.

29266. MD-100A8X low audio on SSB

Yahoo group: FT897 (2010)
Date: 2010-02-27 15:03:12 UTC
From: Hank
Topic: 29266 Message: 29266

I recently added an MD-100A8x to my FT-897D. On 2 mtr FM, I get great reports. I have the FM mic gain at 75, proc at 30, and on the mic I have both high emphasis and low cut off. According to the reports I get on the repeater, it sounds great.

On HF SSB, the mic appears to have no drive. I have the SSB mic gain set to 100, and with the FT-Meter set for modulation, the meter barly moves. With this mic, I have only made 2 HF contacts, both with weak signal reports. When I plug in the handheld mic that came with the rig, I drop the gain back down and I get good reports on HF. Plus, the FT-Meter shows good modulation and good power out.

Has anyone else experienced this. I spoke to a few people at the recent Orlando Hamcation that had the same issue, and ended up replacing the mic with another brand. However, on eham I read page after page of excellent reports. Is there a setting somewhere I might be missing?

Any help is greatly appreciated.

Hank / KB4MTO

29267. RE: [FT897] Re: Serial Numbers/Indicators for 60 Meter/TCXO Addition ?

Yahoo group: FT897 (2010)

From: Mike Ernst
Topic: 29258 Message: 29267

I'd like to add some "confusion" to the serial number issue in hopes of someone helping me out - because Yaesu Tech Service was no help on this. My serial number on my FT897D is 9C080048. Now based on the description below that means it was made in January 2009 and was the "0048th" rig in lot "08". However according to Yaesu the FT897D started with lot 029. (They sent me a written document stating this,) So I called to try to get a further explanation. I asked if they restarted the two digits once they hit lot 99 (thinking perhaps my rig was from lot 108 rather than 08). According to the tech that is not the case. I then asked when the production started on the rig and was told the year 2002. I asked if then they had only run 8 lots of this radio since 2002 and was told by the tech he did not know because the rig was made in Japan. I pointed out to him that the rig was to my knowledge an FT897D and that the production started with lot 029. He again told me he did not know since the rig was produced in Japan. Needless to say I ended the call pretty frustrated with the quality of service I got.

Can anyone clarify this for me?

73,

Mike, AE8U

To: FT897@yahoogroups.com
Subject: [FT897] Re: Serial Numbers/Indicators for 60 Meter/TCXO Addition ?

Copied from the files link on the left:

Simple breakdown of the Yaesu code is below:

Position 1 = year made
Position 2 = month made
C = January
D = February
E = March
F = April
G = May
H = June
I = July
J = August
K = September
L = October
M = November
N = December

Position 1 = last digit of the year in which the radio was produced
Position 2 = month made
Pos 3 &/or 4 = lot number(s)
Pos 5<-8 = sequence in that lot

Example - My FT897D 4H370xxx would translate to:

4 = 2004
H = June
37 = Lot number 37

Jason,

Thanks for the update and correction. Do you have a new service manual then for the FT897D?

Subject: [FT897] Re: No voltage at CAT jack

Hi Mike, and Everyone,

Thanx for the post mate, as a matter of fact, Thomas DG8FBV just sent me the details that I needed.

There is a difference between the two boards and the service manuals do reflect the new arrangements of the real estate.

In the new board (Lot 25+), Q1108 (2SD2211) is moved away from where it is on the first board, you may note Jumper J1027 is included in this iteration of the board also. R1529 is now on the board in the position where Q1108 maintained in earlier boards. In fact, Im still trying to locate it actually but its not important for me at this stage.

What I *thought* was the right fuse in fact was. The Fuse itself has the number *3* stamped on it. I had already noticed this, and compared it to the file in the group files section labelled FT-897 ACC Fuse Placement-1. I just wanted to be sure that that was exactly what I looked for. I already had an open circuit reading from my multimeter so it was a pretty good bet.

I just wanted to make sure before I correct it with a poly switch as I am about to sell it at a HAM Fest here in New South Wales Australia tomorrow.

So thankyou all for posting or emailing, I really appreciate it.

Cheers and 73's

Jason

If that were the case (and I am not saying you are incorrect) then it seems there would be no meaning to the following excerpt from the document sent to me by Yaesu:

FT-897 series

-LOT 001 to LOT 028: JP1006 is placed (meaning, no capability of the 5 MHz band operation)

FT-897D series

-from LOT029 and later: JP1006 is NOT placed (Possible to operate the 5 MHz band)

In other words what they are saying is that LOTS 001 thru 028 were FT-897 and all lots after that were FT-897D. So if they start the loit numbers over each year there is no way you could tell by lot number if you had th”D” version or not.

I bought mine new and it is a 2004 897D and shows to be lot 34. So, if they used sequential lot numbering, yours would have to be higher than 34, which its not. I understand new units are made somewhere besides Japan? Maybe they started new lot numbers with units made outside of Japan?

Chuck, as far as I know the D model has the 60 meter and tcxo additions. This is the upgrade from the older FT-897.
One thing to look for is an opened up or MARS modded unit as it wipes out the 60 meter memories, but you can manually put them back in.
There's a file here on this site you can upload which has about 150 memories set and you can modify them for your personal settings.
It was a good base for me to start with.
I've had 2 897D's and they are great rigs.
You'll like the radio and don't worry about the Serial Numbers/Indicators for 60 Meter/TCXO Addition. If it's a D model it has it.
73's,
Bill

29274. 897d default settings

Yahoo group: FT897 (2010)
Date: 2010-02-26 16:00:51 UTC
From: kj4sln
Topic: 29274 Message: 29274

There are the default settings and there are settings that work better for different bands. Can anyone give me a good setup for the 2 metter Band. I will be hitting a near repeater and some simplex. I had the radio for 2 wks and want to start out right. Radio receives 100% just never talked on it nor checked the swr's. didn't want to break the radio or make someone upset. I don't belong to any groups other than on line, and don't I want to do a show and tell with a stranger.
Allen kj4sln

p.s. Is there a way to erase all the freq in memory for favorite freq. all at 1 time?

I recently bought a 706mkIIg to compare to my 897 d. Price was right and why not. The 706 was much quieter at first when I compared them. I enabled ipo and tweaked the unit a little and lo and behold the 897 was as quiet as the 706. On my 897 it's default is ipo off (preamp on) on all bands. Not sure why. I have changed that. I have since sold the 706 and have been discovering what an awesome radio the 897 is.

Bill Riches, WA2DVU

Cape May, NJ

I sure hope that not many people have to send their 897d into the Yaesu Service Center in California for service is it takes forever to get it done and get back to you !!! They do NOT communicate with you unless you keep calling them!!!!!!

I am an Official Observer here in Indiana and I can honestly say that Yaesu does NOT have the Quality that it used to have at all !!! I hope that Toyota has not bought a part share in the Yaesu Company as that would explain a lot when it comes to the loss of quality on these radios by Yaesu!

My experience with Yaesu repair service has been all positive. I had a FT907D that had a noise problem. Yaesu communication was great!. After they received my FT897D they called me with the estimate and also sent a card via snail mail with the estimate. I received the unit back in about 2 weeks. Yaesu has great communication, great turnaround time and they fixed the problem at a reasonable price So... in my experience with Yaseu service was all positive.

29279. Noise Test

Yahoo group: FT897 (2010)
Date: 2010-02-28 17:20:07 UTC
From: Steve Yates
Topic: 29279 Message: 29279

Here is a quick and easy test to determine if the noise is due to a defect in the FT-897D design or if it is from an external source and your receiver is just more sensitive then others. Switch from your antenna to a dummy load and listen to what happens to the noise. If the noise goes away it is NOT coming from your radio. Just disconnecting the antenna is usually a good enough test but the noise figure of the receiver is optimized when terminated close to 50 ohms so the test is often more dramatic when switched to a dummy load.

I guess it is human nature to think we get the best performance when everything is set to maximum but in this case the FT-897D has too much receiver gain for HF in most cases. This would come in handy though if you were using a negative gain receiving antenna like a Beverage or terminated loop antenna to enhance you reception in noisy environments.

The FT-897D's DSP operates at the audio frequencies and as such is not the latest technology. It can be used to reduce the effects of received noise but has limited ability. Usually audio fidelity is reduced as well as the noise. In this case a receiver with a DSP operating at the IF stage will perform better. However, with proper use of the IPO, Attenuator, IF Shift, BW Filters and RF Gain control you can greatly reduce the effects of noise yourself. In noisy environments like most of us have these days dedicated receive antennas might be useful too.

Also, I would ignore the S-meter. The FT-897D's S-meter is not even close to the 6 dB per S-unit that some manufactures use to strive for. The "meter" is overly sensitive on the low end of the scale and should be used for relative measurements only.

Steve:
My 897 is hooked up to a MFJ antenna tuner (manual) so I switched over to "dummy load" and "yes" the noise vanished, so it's not the radio? Is it then my antenna? Is the antenna pulling in static? My antenna is a G5RV, about 25 ft up. So, should I try another antenna? Move the current one? What would be my next step?
Thx
Bart

Hi Bart,

You are correct, it is not the radio. The noise is being picked up by the antenna just like it would pick up any other signal. In today's world just about everything emits RF, even maybe your coffee pot! That being the case your and your neighbor's homes are usually the major source of noise locally. First, try to locate the antenna as far from houses as possible. Next, try to tackle the sources. Major sources that I have found are the following:

1. Touch lamps.
2. Battery chargers. The new light weight charges for cell phones, laptops, and power tools use switching supplies that can generate huge amounts of noise unless the extra nickle is spent to properly filter them.
3. Televisions, mostly the plasma display type.
4. AT&T Uverse "2Wire" brand routers. This is a huge problem in my area.
5. Everything else with a microprocessor.

You might try to run your rig temporarily off of a battery and turn off the main breaker to your house just to see how quiet you may be able to get your environment. At least this will let you know if you have work to do searching for sources.

The natural atmospheric noise level increases as you decrease in frequency. Below 15 MHz it increase fairly rapidly and of course is worse in the summer time due to lightning static.

The most important thing to do is to try and keep all parts of your antenna out of or away from your house. This also means taking measures to keep common mode currents off of the coax. You can do help this by using a current balun near antenna to act as an RF choke for RF currents that may be on the outside of your coax.

There is no easy solution. That's why us hams complain so much about BPL and such technologies. It seems like a losing battle at times since the FCC is more concerned about getting technology out cheaply rather then enforcing their own rules. I can still remember when the only noise I heard on 10 m was galactic noise! Now all I hear is AT&T Uverse which is piped all over my neighborhood.

You also forgot to mention the area in which you may live in may be a source of noise as well. It is well known that commercial/industrial locations produce a HUGE amount of noise as well. Especially from the power lines as the draw on the power system is greater than a residential area. If you live close to one of these areas, you will pick up A LOT of noise, mostly during the day, but if any have a 24 hour operation, you will have noise almost continuously!

"Chuck, as far as I know the D model has the 60 meter and tcxo additions. This is the upgrade from the older FT-897."

Thanks for the follow-up Bill. I've been thrown by whether all 897D's have the 60 meter & TCXO, because the magazine adds still say "now with 60 meter & TCXO" as if it's an enhancement to the original 897D.

Thanks for clarifying that for me.

Subject: [FT897] Re: Serial Numbers/Indicators for 60 Meter/TCXO Addition ?

Chuck, as far as I know the D model has the 60 meter and tcxo additions. This is the upgrade from the older FT-897.
One thing to look for is an opened up or MARS modded unit as it wipes out the 60 meter memories, but you can manually put them back in.
There's a file here on this site you can upload which has about 150 memories set and you can modify them for your personal settings.
It was a good base for me to start with.
I've had 2 897D's and they are great rigs.
You'll like the radio and don't worry about the Serial Numbers/Indicators for 60 Meter/TCXO Addition. If it's a D model it has it.
73's,
Bill

From: ZephyrNYC
Topic: 29294 Message: 29294

By the way, what are the differences between these brands of filters?
I heard that Yaesu filters are more expensive than the after market
ones, even though one of the after market brand's filters are exactly
the same. Which of all the filter brands offers the best performance?

29295. Re: [FT897] Re: Noise Test

Yahoo group: FT897 (2010)
Date: 2010-03-01 10:04:49 UTC
From: Richard Corfield
Topic: 29279 Message: 29295

There are a few noise sources near where I live. I found when I took the 897 camping, in the middle of a field with a battery and a long wire antenna, I could hear a lot with very little noise. I've not compared with other radios in this situation, but it shows that for me at home the noise problem is all the plasma TVs and broadband routers and other bits and pieces in our area.

The Palstar AT-AUTO works okay at 6M but I only use it on the HF bands. I home brewed a 6M tuner a while back. Very inexpensive and with air spaced caps it could easily handle the 300 watts I use on 6

29297. Re:Noise Test

Yahoo group: FT897 (2010)
Date: 2010-03-01 15:29:07 UTC
From: David Okrent
Topic: 29279 Message: 29297

I agree that is the best test. Also, as a TS440SAT past users playing with RF Gain, IPO, etc. is pretty natural for me, but it's not only noise it's fidelity and the Kenwood audio amplifiers seem to my ear to have more fidelity and discrimination, so the voice tends to come through a bit better over the noise than it does on the FT897D. However, I also admit that I may just be having a reconstructed memory as I can't compare the rigs side-by-side given I solt the TS440SAT to get the FT-897.

I owned several Kenwoods and had my 897 beside 2 Kenwoods (a TS50 and a TS2000) and your right about the difference in audio...I wouldn't buy an 897 for its audio...You better want it for its features or you will be disappointed...

Did you try auto detect and let the computer cycle through all of the combinations? I recently picked up a CT-62 cable on eBay that uses a USB connector and you can download the driver and it works pretty well. I picked it up out of Rexburg Idaho.

I had the same problem
The com port was wrong
Use auto detect to get the correct com port, click on that set as the one to use on start up, then restart HRD.
(Leave the radio on)

Use HRD v4.1 (or 5) so it picks up the QRZ info.

Also, John,

have you checked that teh port is set to CAT and not to Linear? When set
ot Linear the CAT does not work. If you are using a linear and need it set
to Linear, you may need to use the front CAT port which connects via the
Microphone socket. You just need a small adaptor cable to connect it.

Also make sure the cable is inserted correctly. Yaesu designed the port somewhat smaller than the housing around the plug requiring many of us to have to trim the housing on the cable a little to get the plug to fully insert into the port.

29306. Re: wrong "mode" adding log entry on HRD

Yahoo group: FT897 (2010)
Date: 2010-03-01 21:21:59 UTC
From: iz0inx
Topic: 29178 Message: 29306

Thanks for checking Bryce, yes, it may be that in the v5 this has been fixed.
I'm still using the v 4.1 build 2321 Beta, which is the last version before the architectural revolution on HRD.
Anyway, all settings are ok, everything is working fine, but the mode in the ALE (Adding Logbook Entry) window.
I've also monitored the data traffic on the serial interface, it looks like the packet containing the mode information is correctly sent.
So, I'm afraid it's a HRD bug

cheers,
Fil IZ0INX

29308. Newbie Help with USB CAT Cable for FT897D

Yahoo group: FT897 (2010)
Date: 2010-03-02 20:25:49 UTC
From: pascalpete
Topic: 29308 Message: 29308

Searched online and this forum...please forgive the newbie question...

I am thoroughly confused regarding the CAT cable for the Yaesu Ft-897D. I am a new ham and a new owner of this radio (bought it used).

I have heard people/websites speak of a "CAT" cable and a "programming" cable.

Question #1: Are these the same thing? I *think* so but am not certain.

Question #2: I have looked online for the USB version of the cable and I keep coming across vendors out of Hong Kong with a USB cable with no software. Is this a bad idea? I am not keen on ordering something from so far away...and what about a driver for the USB cable? This seems like a bad idea.

Question 3: An electronics store I have bought stuff from in the past indicates there is a $40 software package (advanced data management) that comes with a USB cable that is "officially" sanctioned by Yaesu...but the reviews of the software indicate it is terrible...and I don't think I NEED the software...just the USB cable and driver (seems like there are lots of software packages out there, both free and for pay).

The BIG question (3) is: Can anyone point me to a trusted source for a USB cat cable (and driver) in the US? Or am I completely not understanding this whole CAT cable thing?

I am very computer savvy and have no desire to mess with a DB-9 serial port-to-USB converter.

Again, please forgive the newbie questions...and thank you in advance for any constructive advice you can offer.

Hi Peter,

The CAT cable is the Yaesu CT-62, sales for $30.00 at Gigaparts. This cable can be used for programming the radio and for programs such as MixW or HRD. You will need a Serial to USB adaptor. I use a USBGear FTDI logic device (sales for $24.95 from USBGear. The USBGear adaptor works with Windows XP, Vista, and Windows 7 as I have had all three with this adaptor. As for programing software I use FTBasicMMO available online for around $20.00 (I think). Hope this helps.

Thanks for the feedback, Bob.

Is there no "native" USB cable that will do the job?

Thanks.

From: Mike Ernst
Topic: 29308 Message: 29312

Peter,

First of all CAT stands for Computer Aided Transceiver (according to my FT-897D Manual). Essentially it is a data port on your rig that can be used for a computer to pass commands to the rig. On Yaesu it is an 8-pin mini din connector (the same connector as a computer keyboard used to use at one time before they all became USB). On Yaesu it can do two things. It can be used to program your radio, such as reading from or writing to the radio for programming frequencies into memory, or for setting the menu values. It can also be used to control the rig (change the frequency mode, etc.) with the use of the correct program, such as Ham Radio Deluxe.

The intent is for this cable to hook up to a serial port on a computer. In fact the Yaesu cable is a CT62 and I believe it is serial. But Yaesu definitely offers both. They do charge and arm and a leg for them, though. However, many computers these days have no com ports. So the solution is to either buy an 8-pin to serial cable and a serial to USB converter cable and hook them together, or buy a cable that goes directly to USB. In this second case they have actually built in the serial to USB converter chip right in the cable. I bought my cable from China and other than slow delivery (about 2 weeks for it to get through customs) it works great. The disk that comes with the cable is the Windows Driver disk.

The software you use then really depends on what you want to do with the computer. If you want to do rig control, there are lots of free programs. I use Ham Radio Deluxe and love it. But if you are going to work digital modes you will need another cable run and a separate sound card to do the converting. Some folks use the PC sound card, but that causes other issues because windows want to use that card for sounds and the Rig Control software wants to use it for rig communication. So best to just have the separate interface.

If you want to program the radio, I think most of the software is not free. I use FTBasicMMO which works well, I know there are others.

I think this answered most of your questions. If you have more ask and I will answer as best I can.

73,

Mike, AE8U

Subject: [FT897] Newbie Help with USB CAT Cable for FT897D

Searched online and this forum...please forgive the newbie question...

I am thoroughly confused regarding the CAT cable for the Yaesu Ft-897D. I am a new ham and a new owner of this radio (bought it used).

I have heard people/websites speak of a "CAT" cable and a "programming" cable.

Question #1: Are these the same thing? I *think* so but am not certain.

Question #2: I have looked online for the USB version of the cable and I keep coming across vendors out of Hong Kong with a USB cable with no software. Is this a bad idea? I am not keen on ordering something from so far away...and what about a driver for the USB cable? This seems like a bad idea.

Question 3: An electronics store I have bought stuff from in the past indicates there is a $40 software package (advanced data management) that comes with a USB cable that is "officially" sanctioned by Yaesu...but the reviews of the software indicate it is terrible...and I don't think I NEED the software...just the USB cable and driver (seems like there are lots of software packages out there, both free and for pay).

The BIG question (3) is: Can anyone point me to a trusted source for a USB cat cable (and driver) in the US? Or am I completely not understanding this whole CAT cable thing?

I am very computer savvy and have no desire to mess with a DB-9 serial port-to-USB converter.

Again, please forgive the newbie questions...and thank you in advance for any constructive advice you can offer.

There are several sellers on Ebay that carry the USB cable you need. CT-62 USB.
I use a serial cable as my laptop has a serial input on it. It works perfectly.
The price was about $20.
I would go with a USB cable as that's the way the PC's go these days.
I use HRD and also the ADMS-4B programming software.
If you need more info contact me off line at k3waw@...

29316. WTB: Inrad, W4RT or other 300Hz CW filter for my FT-817

Yahoo group: FT897 (2010)
Date: 2010-03-02 21:17:42 UTC
From: Bob - K2KI
Topic: 29316 Message: 29316

Hi all,

As the title says it all, I am looking for a 300Hz CW filter for my newly acquired FT-817.

I know John Geiger AA5JG was asking for one the other day so I don't want to take a potential buy from him, so if you have contacted him and he says he is all set, then please contact me offlist if you have one.

I can pay with PayPal or Money Order.

I look forward to any responses.

Thanks es 73...

Thanks for checking Bryce, yes, it may be that in the v5 this has been fixed.
I'm still using the v 4.1 build 2321 Beta, which is the last version before the architectural revolution on HRD.
Anyway, all settings are ok, everything is working fine, but the mode in the ALE (Adding Logbook Entry) window.
I've also monitored the data traffic on the serial interface, it looks like the packet containing the mode information is correctly sent.
So, I'm afraid it's a HRD bug

cheers,
Fil IZ0INX

Yes there is a third party CAT cable with the serial converter built in so it can be used for SUB ports for about $35. You can find it HERO, Cheap Ham, etc. However, getting the right drivers can be difficult, but not impossible via the Internet. For my laptop the drivers are fine, but it only works with Com 6 using HRD. Maybe me, maybe my piece of crap Toshiba (never buy Toshiba computers).

Jon,

You're right - I misspoke. The 8 pin is the CAT port for rig control. The 6 pin is the Data port.

In HRD Suite, you can have both ports connected via separate cables to USB ports on the PC (I do on mine). HRD main program uses the CAT port via one USB cable (direct from radio to PC) to control the radio (switch frequency, change modes, edit menu settings, etc.) DM780 uses the data port via a second cable that actually runs on my rig to the SignaLink and then from the SignaLink to a second USB port on the PC for digital work (PSK, MT63, Olivia, etc.)

Sorry for the confusion.

73,

Mike, AE8U

29330. Re: Newbie Help with USB CAT Cable for FT897D

Yahoo group: FT897 (2010)
Date: 2010-03-06 15:34:56 UTC
From: bob.thornton26
Topic: 29308 Message: 29330

I just received one of those cheap USB cables off Ebay from Hong Kong with no software, ten days order to doorstep. I managed to identify it as based on a Prolific 2303 chip and downloaded their driver. It failed to work on Vista. Searched and found a workaround http://alquistconsulting.blogspot.com/2006/11/prolific-pl-2303-usb-to-rs232-on-vista.html suggesting to install it on Win98 first and then copy folder across but then someone suggested http://www.cooldrives.com/wividrforprc.html which worked first time for me and I have now got Ham Radio Deluxe working fine with my 897 and laptop. Will fire up the Win98 that will act as my server later and then try the original driver from http://www.prolific.com.tw/eng/downloads.asp?ID=31 first. Hope this helps.
I have been off the air for 35 years so I must now rank as a Newbie again despite my 1967 callsign!

29331. Problem with two meters shutting down to 6 watts output only

Yahoo group: FT897 (2010)
Date: 2010-03-03 06:46:08 UTC
From: Owen
Topic: 29331 Message: 29331

Well was having a problem and all of a sudden all I could get out of the radio was 6 watts output On 2 meters on 147.090/147.690 repeater checked the antenna swr with the cross needle and it was 1.2:1 which should not have been a problem and was running 50 watts output. Checked the power supply of the fp30 it is good help please. the call is AC8OH.

29332. FT-897 ALC and digital modes looses alc drive ?

Yahoo group: FT897 (2010)
Date: 2010-03-04 17:43:40 UTC
From: Ron
Topic: 29332 Message: 29332

Hello All,

I have had my ft-897d about a year, got most of the menu functions
down pat but have a question about alc drive and digital modes.

Sometimes when changing frequency via dial or memory, after I go
to transmit I have no alc drive in my display any more and I did not touch sound card
settings in the rigblaster plug and play.
If I am using winwarbler for psk and hit the optimize button
that seems to bring back the proper alc drive and display.
That button says it sets the xcvr frequency for optimal audio offset.
If I try oliva in multipsk, If I dial in a oliva transmition and then start the program all
is fine. Once I hit transciever control and change
a channel/frequency I loose alc drive / display .

For a newbie to digital modes what am I doing wrong ? :-)
Do I need to set audio offset before first transmissions... ?

Thanks, Ron

29333. Alignment & tune up

Pardon the newb question, but...
Does the FT897D need any type of tune & alignment? I bought this unit brand new from HRO a few years ago, and never had it tuned up. Is this something that should/needs to be done? If so, any suggestions where I can have this done. My QTH is Vancouver, Washington.
Thank you!

Hi!
You should not need to tune up any of the Solid state radios unless you've made changes such as replacing the transistor. But, if you do decide to tinker, there are several bias adjustments that are posted on the internet that will be wrong for your version of the radio. In fact, I've found postings from people who claim to have found the bias set wrong on their radio when in fact, the initial settings were correct for the revision of the radio they had. In any case, make note of the Before settings incase you find you need to go back to them.

My opinion is that unless you have a verifiable problem, leave the alignment alone.

From: Tom Ahola
Topic: 4195 Message: 29336

Hi,
It is not possible to enable SWR scale readings. I also find the lack of SWR scale information on the radio or manual very annoying. I created a printable scale that you can find from the files section of this group. You can stick it on top of your radio, add to you manual or memorize it. Some claim there are errors in my scale because external FT meters you can plug to the socket under the radio has a different scale. However, I believe the external meters are wrong because their infinite SWR tick is not at the full scale of the meter and thus they show more than infinite SWR at very high mismatch conditions. Anyway, consider the SWR only as an indication, not an accurate measurement.

29340. Re:FT-897 ALC and digital modes looses alc drive ?

Yahoo group: FT897 (2010)
Date: 2010-03-07 15:40:10 UTC
From: Jon Perelstein
Topic: 29332 Message: 29340

Ron,

I'm not sure what you mean when you say that "after I go to transmit I have no alc drive in my display any more"? Do you mean that you can't set the meter display to ALC, or that the bar graph is not displaying any ALC when you set the meter display to ALC?

1. If it's the former (you can't get at the ALC display):

Just to review the settings: ALC is shown as one of the meter displays and is accessible through Multi Function Row "i" (MFi). Press the F key, then rotate the MEM/VFO CH knob to get row i on the display. Then use the A key to allow display and the B key to select what is displayed on transmit. You can cycle through PWR, MOD, SWR, ALC while transmitting (a very nice feature).

If it's this, I'm not sure. Try the A key to enable ALC display -- but do it on the band/with the memory item that you're using to try to transmit. On the FT-897, there are some things that stay the same as you move from band to band and some things that stay the same (even if you're not in memory mode) and this may be one of them.

Also, check menu item 61 (MTR ATX SEL) which is used to select the meter display configuration when transmitting.

2. If it's the latter (you're just not getting any ALC reading, but you can see the ALC meter).

This is a good thing!!!! You do not want ALC when operating PSK. ALC indicates that you have to high an audio level into the rig and you're overdriving the modulation process. That results in a distorted signal and also result in a PSK signal that is much wider than it should be. In addition, at a high enough level it will actually result in "ghost" signals -- people will see your signal at two different spots on the band.

The West Mountain Radio people have a very good suggested approach for setting up a radio for PSK, as follows:

a. Set your rig's power at or near full power.

b. Set the output from the computer (the playback volume of the speaker/line) and/or the transmit volume control of your interface (if it has one) and/or the input volume of the rig (in this case FT-897 menu item 37) so that you get the desired power output (typically 20 or 30 watts for PSK). Use a combination of as many of the controls as you have so that no one control is at a max or min extreme.

That should give you your desired output with no ALC reading -- thus giving you a nice clean signal with good IMD and S/N ratio. I use this approach and have experimented using an IMD meter -- my cleanest signal is when I follow this approach.

An external meter is probably the only way to get real numbers for any of this. Check out the LDG meter for the 897. It may be about the best bet for getting what you want.... or adapt a surplus meter movement by adding your own meter face if so inclined.

Mark Henman, If you are new to Ham radio I would suggest that you you scan the radio during the times that you want to listen and write down the the frequencies that you hear activity on. There are often repeaters listed some place but little activity. Then ask the people you hear if there are other frequencies. Remember you might have to search for a ton. For those that couldn't find Mark in a data base try eHam. Good luck in your venture into Ham radio Stewart Nelson KD5LBE

From: oldmayorkd5lbe
Topic: 29331 Message: 29343

Take your manual and go over every setting in the back and be sure that they are right. Some place in our thread there was another Ham with exactly the same problem about a month ago.

The biggest problem we have in Ham radio today is that there are to many buttons and two many settings for each button. Start from the beginning with every button.

Any Heil will be great with the 897. For a desk mic I use the HM-10 Dual. That mic has BOTH elements in it, the HC4 and HC5 so I get the best of both. I use Heil on all my radios. From the Proset Plus, The Travler headset and I have an older HMM-10 (I think) which is a hand mic. I even have an adapter to hook up the Travler head set to my VX7 HT. Whateve you choose you won't go wrong with them.

Michael, you might look at MultiPSK. It handles LOTS of digital modes, including SSTV and PSK 31. The free version will work well for you. I use WinWarbler for PSK 31 most of the time. It is one of the DXLab Suite of programs, and as such interfaces seamlessly with the logging program DXKeeper, as well as Commander for rig control and several other programs. Actually, MultiPSK will log to DXKeeper, as well. Another good thing about both of these programs is both of their authors are very accessible and offer great support!

73,
Ken

Sean, are you from Hawai'i?

By the way, who makes those vintage radio looking mics- the custom ones that you can get with your callsign? I thought Heil makes them but didn't see them on their website. Thanks.

DE N7UVL,
The LDG AT-897 does not fit flush when using the mobile mount
without a minor mod.
-Go ahead and mount the mobile mount brackets first, before
attempting the AT-897 mounting.
-Although a bit of nimble" finger manipulating is required, a
couple of washers for spacers between the AT-897 case
and the FT-897 case placed on each of the lower mounting
screws in order for the AT-897 to align the mounting that would
eliminate the "cockeyed" look./ga

The stock hand mic that came with my 897 works just fine. I got the MD-100A8X because I like desk mics, just a personal preference.

I do know that the Heil GM-5 has 2 elements, allowing you to use 1 element for normal use, and the other for added punch to help break through pileups. I am considering this mic, because I am limited to a 19' dipole in the attic, and using a compromised antenna, the added punch of the DX element might help me make contacts.

From: Richard Corfield
Topic: 29344 Message: 29356

The hand mic is conventiently to hand when you need it. A headset or desk mic can be used with VOX which is really convenient if you're typing or writing or doing other things with your hands. Headsets are best in that situation because you can be quite sure they're picking up your voice and not so much other noise. Just don't sneeze when VOX is enabled ;-)

I've experimented with a Behringer 8500 vocal mic on a small stand on the desk. That worked very well and got good reports. I used a Behringer Shark DSP-110 to interface it which allowed me to play with the high pass filter and compressor. This kit is relatively cheap. The mic may be able to interface directly to the radio if you don't want any processing.

From: David Okrent
Topic: 29357 Message: 29357

I have the LDG-897 Tuner and I had a bit of surprise this last weekend that I thought I would see if anyone else had this occur. For the first time I attempted to tune on the 60 meter band with my 40 meter long OCF dipole. The tuner started to run through it various combinations and then it stopped, but kept the transmitter keyed until I pressed the autotune button again. This only happens on the 60 meter band. Anyone experience this before?

Yes, this happened to me about a month ago the one and only time I tried to tune up 60 meters. I assumed it is because I am tuning a 19' dipole on 60, and it's just too much. It is the only time this has happened with the LDG tuner.

29360. Re: Mic Suggestions

Yahoo group: FT897 (2010)
Date: 2010-03-10 16:04:02 UTC
From: Steve Yates
Topic: 29344 Message: 29360

I use the stock hand mic most of the time but I recently converted an old D-104 style desk mic with a 10DA high impedance head (still have the D-104 too) for use with the FT-897D. It was unamplified but the impedance was way too high for the FT-897D. A couple of weeks ago I built an FET buffer to convert the 100 k microphone impedance down to about 600 Ohms and put it in the base of the microphone. It works great and drives the FT-897D just right. By design, the 10DA is tailored for SSB and tends to respond best to the higher end of the audio spectrum when matched to its characteristic impedance. It's a little too high pitch for FM but just right for SSB and the old D-104 head is just right for AM. I tailored the buffer to respond down to about 100 Hz even though I doubt the rig will pass frequencies this low normally.

Adapting older microphones may offer a lower cost alternative to the Heils, Berringer setups, and whatever other new and expensive fads that may come about.

I still find myself just using the hand mic most of the time because it's smaller. On HF I usually just operate CW anyway.

73,
Steve - AA5TB

This happens here too but on 40M - the rig even shut down once - RF everywhere, so I don't go on 40M now till I get a half decent antenna for that band. (Using a random length long wire in a 25ft yard so it's folded back under itself, and obviously rubbish :0)

I'm sure it's RF in my case. I have a small dipole in the attic, so it only makes sense. I have a current balun at the rig and it helped out tremendously, but still that problem on 60.

I also have an Arrow dual-band J-Pole about 4' from the dipole also in the attic. I am wondering if RF is coming back into the radio through that antenna. Later on I am going to disconnect the Arrow from the 897 and see if it is still happening. I'll report my findings back to the group.

29369. Re: LDG-897 Tuner

Yahoo group: FT897 (2010)
Date: 2010-03-12 13:36:06 UTC
From: bigiantrike
Topic: 29357 Message: 29369

Hi there
I have had a bad experience with RF shutting down my rig when using the LDG-897 tuner.. My antenna is a real compromise and I was half expecting real problems with it when I first set up the station. The station at that time consisted of the FT-897 along with an MFJ-993b intellituner and the antenna sirio 827 vertical. This antenna is really an 11 mtr vertical so as you can realise I was expecting all sorts of problems when tuning to other bands... I have to say the MFJ sorted out all the problems with no great fuss and it was only when I upgraded to the LDG-897 that all the problems started. These problems included auto shutdown, memory bank wiping and bad audio reports. I tried all sorts of remedies with ferrite rings on feeders.. air ballens at the base of the antenna...none seemed to stop the problems so I resorted back to the MFJ.. I now use the MFG in my camper along with my FT-857 in conjunction with my mobile antennas which are 20mtr delta loop and 23ft vertical fishing pole type antenna with a base fed UN UN ballen.
None of the problems I experienced before have manifested themselves in my mobile setup. These are just my experiences and you have to make of them what you will...but I was very disappointed with the LDG...having said that I'm sure it was all about using the Sirio 827 vertical antenna and my transceiver location.

Hope this helps

From: Roger
Topic: 29370 Message: 29370

I have had my "AT-897 Plus" tuner for a little over a month now. I am having what I think is a problem. Some times (10%) when I change bands and press the button, until the LED lights. The tuner mutes the radio but no RF or reduced power shows on output and no actual tuning cycle occures. At end of this false cycle red LED flashes 3 times. I also get a loud buzz in the audio on the FT-897D at the completion of a tuning cycle for approx. 1/2 sec. Any ideas. LDG seems to think I have the dreaded "RF in the shack" syntrone. Roger K8CIX

I have a new (zero hours) Yaesu FT-897D with TCXO, collins SSB filter, internal power supply, internal battery pack (2 batteries) with the charger, LDG AT897 tuner, all the boxes Tech and General study books, 40 foot tubular crank uptower, hygain? triband beam 10,15,21 meter, laser 400 (12 element) beam, moonraker 4 beam w/ new rear rejection kit, pdl II most of it, top section of a Rohn? tower, 2 rotors with controllers for sale.

$1500.00 takes all. come and get it plus anything else I may find to throw in.

29376. TNC won't send ptt to 897d when in fm mode but will in DIG mode.

I have tried two TNC's, Pactor PTC-IIex with Pactor III upgrade and the KPC-3+. Both do the same thing. When I try to connect to an airmail station, the TNC won't send the transmit and the radio won't transmit. If I put the 897d into DIG mode, then the TNC sends transmit and the radio transmits but I can't set a repeater offset in DIG mode.

If I unplug the cable that goes from the tnc to the radio, the tnc will send transmit but when it is connected, it won't.

I use a completely different set of cables for both the tnc's to the radio but use the same usb to serial connector for both the connections from the laptop to the tnc's.

Ideas please.

Hello there
You have a great radio I use one myself

The easiest way to program it is using the 897 programming software

Where do you live I am in milton keynes and if you require help in programming the radio please do give me a shout..
spl shows for split frequency use and it has to show + or - for repeater use

Subject: [FT897] repeater operation

I just bought this radio on Ebay. I want to love it! But, being at the very bottom of the learning curve, I'm having some trouble. There is an SPL in the upper left corner of the display. I think it's supposed to display + or - depending on the offset for a particular repeater. However, I can't figure out how to get rid of that SPL. Can anyone help me?

If you have the owners manual, I suggest you read it BEFORE operating the radio. The "spl" can be changed from the multi-function menu. To access this menu, "tap" the "Func" key and rotate the select knob until you see "spl" in the menu above the corresponding button under the display. Press the button and "spl" will disappear from the upper area of the display. "Tap" the "Func" key again and rotate select knob until "Ton" appears in the menu. Press the button and "tsq" will appear for the PL Tone. Same thing to get "-" or "+", but you are looking for "Rpt" in the menu.

I David,

Have you tried it using a programmed memory to select the channel or only using the VFO? Actually I just tried it opn my 857 and it didn't work.

How about using split?

Alternatively, you may have to use the microphone connector to use it on that particular frequency

73....Eric VK2VE.

ok here's my 2 cents

wat baudrate do you make 1200 or 9600?

and wich mode do you want to use?

packetradio:
for 1200 you can leave the rig in fm mode no problem and rep offset works fine afsk signal is ajusted in the menu dig gain and all works fine for me

running the pk-232 in kiss mode 1200 baud or tnc2c

a lot of german packet acces points use 7.6hz downshift

i also tried putting the rig in dig mode and you are right the rep offset doesn't work

for packet radio use u should use the pkt mode then offset works

for ssb modes you should try put the rig in split vfo a/b 1 is tx freq and the other vfo rx freq

good luck

Both HRD/DM 780 and Digipan properly switch the radio into transmit mode but the radio does not show any RF power output regardless of the digital mode used (PSK, MT63, Olivia). I can hear tones being generated by the computer but they are not being transmitted by my radio. When I monitor the signal on a second radio, there is nothing heard.

I am using a laptop computer and a Buxcomm Rascal interface connected to the data port on the back of the radio. Menu 38 = User-U and Menu 37 = 50. I've tried cranking DIG GAIN all the way up to 100 and still no RF out!

The frustrating part is that I just had things working earlier this week but I must have inadvertently changed something. I think it's a radio setting since I have this problem regardless of the software that I'm using. Any ideas?

29389. CAT - Programs are not reading the radio

Yahoo group: FT897 (2010)
Date: 2010-03-14 00:41:35 UTC
From: brycerichard
Topic: 29389 Message: 29389

I can't get HRD or FTB Bssic MMO to connect with the radio.

I know the cable (CT-62 + USB/Serial converter) and comm port are correct because I tested it with a different 897.

The USB drivers are there because the same laptop see the other 897

I double checked that the DIN plug is pushed all the way in to the CAT port (next to the GRD lug).

Menu #20
CAT

Menu #19
I set the baud rate to 4800 to be safe

Menu #85
Off

Radio in VFO (not memory)

RTS & DTR are on/checked in HRD and FTB Basic MMO

In HRD it comes back with "failed to read frequency"
(The radio is on before I start HRD)

In FTB Basic MMO, it starts "sending" then says "error"
It never gets past the first "block" of memory.

I want to make sure I have checked everything I can before I send the radio to Yaesu.

Any suggestions or help would be much appreciated.

73,
Bryce

29390. Re: CAT - Programs are not reading the radio

Bryce,

Use menu item 059 to check the setting is NOR or RMT.

If you have an original CT-62 then it is powered from the rig. Check you have 13.8V available from the CAT/Linear socket - see the manual page 18 for the pin-out. Lack of volts could mean the fuse is gone.

Have emailed you re a voice contact to debug further.

73,
Bob G4HFQ

29395. Re: No Power Output using Soundcard Modes

Yahoo group: FT897 (2010)
Date: 2010-03-14 23:03:05 UTC
From: JonP
Topic: 29387 Message: 29395

I don't see a previous message from you so we have no idea what interface you're using (e.g., RIGblaster, etc.) or how you have things wired up.

However, if you say you can hear the signals being generated by the computer that rings an alarm bell in my head because -- usually -- you won't be able to hear the signals being generated by the computer when you've got your interface plugged into your computer. That's because -- usually -- you're plugged into the headphone out jack of the computer, and like most devices, when you plug into the headphone out jack the speaker is disabled. IF you're using the line out jack instead of a headphone out jack, then depending on the sound card you may or may not hear the tones being generated by the computer, but even then, more often than not, you won't hear the tones.

To review the connections -- and my apologies if you already know this -- with most sound card interfaces you have to run a cable from the headphone out jack of the computer to the interface device. You also run another cable from the interface device to the mic in jack of the computer. And you run the USB or serial connector from the interface device to the USB port or serial port on the computer.

Is that the way you have things wired -- or better yet, what equipment are you using?

Wow,

I must have been having a bad day and didn't see that the OP specifically said in the second paragraph that he was using a Buxcom Rascal with a laptop. Sorry about that.

Be that as it may, I think my reply was very much on target. If you can hear the tones being generated by the laptop, it means that the interface cable is not plugged in to the headphone out jack, and if it's not plugged in you're not going to get any tones into the interface, which means nothing into the radio, which means no output.

It looks from the Buxom web site as if the Rascal is a passive isolator, in which case it plugs into the laptop's headphone jack and you shouldn't hear the sounds. Some devices use an external sound card. (The Buxom web site lists one that they sell for use with the Rascal). In that case you need to ensure that your software is using the right sound device.

Get Bob's software to program the radio
You can't beat the functionality or the service

http://www.g4hfq.co.uk/ftbasic.html

I posted a question on this group and Bob was the first to responded
He figured out the problem (blown fuse that powers the CAT port).

I got a CAT USB cable from Valley Enterprises through Amazon for $27 and
free shipping.
HRD and FTB Basic MMO now read and control the radio perfectly.

I agree. I have been using the 10-foot USB to Cat Interface by Valley-ent for at least a month/ HRD and I downloaded Bob's software earlier today for programming memories. I was actually surprised when he answered my email so quickly seeing it was probably 12:00AM in the morning his time.

I found the software pretty easy to use. And I did not have any problems loading up 137 memories.

Take it easy and have fun.

29402. Re: No Power Output using Soundcard Modes- PROBLEM SOLVED

Yahoo group: FT897 (2010)
Date: 2010-03-17 00:56:57 UTC
From: drgps28
Topic: 29387 Message: 29402

Thank you to all that responded to my request for help. Everything is working fine now. It turns out that the problem was a bad pin on my home-brewed cable. It just happened to be the audio pin which explains why I was able to switch the radio to transmit but have no audio going into the radio. What I failed to explain in my original message is that I installed a "Y" splitter cable in my laptop's headset port. I have the Buxcom "speaker-line out" cable plugged into one side of the "Y" and an actual headset plugged into the other side. That way I can confirm that my laptop is sending good tones out to the radio. Thanks again for getting me back on track. 73

29403. Antenna switching for 6M

Yahoo group: FT897 (2010)
Date: 2010-03-16 02:02:24 UTC
From: BSA Ride
Topic: 29403 Message: 29403

I am working on a station with the 897D.

I have 5BTV and V2000 antennas. The V2000 will do UHF/VHF/6M
and I want to know if it's possible to switch antennas internally
with the 897 or do I need an external antenna switch?

29404. Re:FT-897 ALC and digital modes looses alc drive ?

Yahoo group: FT897 (2010)
Date: 2010-03-17 02:00:24 UTC
From: Ron
Topic: 29332 Message: 29404

I now use the radio in digital mode (menu #38 usb) for psk mode programs and all is fine now. In usb mode by itself sometimes it would not have proper alc output via the sound card levels and as a result no power output. Put it in (DIG Mode) no more problems.

Thanks for all your help.

Try your radio in dig mode instead of using usb for psk and olivia, I have a plug n play rigblaster and for some reason when I use usb with it for digital modes and the rigblaster I also get no power output, for me no alc output = no power output. Flip it to digital modes for olivia or psk and alc works again..
For dig setting make sure menu #38 is set to psk31-U

If it was strickly an HOA problem, there are many ways around that. My HOA is very strict, and I have an attic full of antennas. I do very well with my comprimised antennas.

To many irons in the fire is another problem. I had to take a 10 year break from ham radio for the same reason. I am now back in the hobby and happier than I was before. Hope to see you back out here sometimes when things settle down for you.

29414. RE: [FT897] Antenna switching for 6M

Yahoo group: FT897 (2010)
Date: 2010-03-17 13:57:32 UTC
From: Dennis
Topic: 29403 Message: 29414

Well, since the 6m band is on the HF connector and the 2m 70cm bands are on the other, you will need to use an EXTERNAL antenna switch between the 2 connectors if you intend on using one antenna as you describe.

Dennis - N8BMB

Subject: [FT897] Antenna switching for 6M

I am working on a station with the 897D.

I have 5BTV and V2000 antennas. The V2000 will do UHF/VHF/6M
and I want to know if it's possible to switch antennas internally
with the 897 or do I need an external antenna switch?

Ben-

First, the TCXO-9

The FT-897 did not come with the TCXO-9, it was optional. It was "standard" on the FT-897"D". I have one but I haven't installed it yet. As far as I know, only Yaesu makes the TXCO-9. This is a crystal oven that stabilizes the oscillator frequency variations due to temperature changes. Some people prefer to add it because they operate digital modes where higher frequency stability is desired. The price is $100 plus. (HRO and others)

Next, filters

The question really is "what do they do", and do you NEED what they do. The filters provide a narrower receiving bandwidth. You may be trying to receive a weak signal. If there is a strong signal close to the weak signal, then the strong signal will cause attenuation of both signals, and it will be hard to hear the weak signal. If you have a narrower receiving bandwidth because you are using a filter, you can tune in the weaker signal and the stronger signal will be "outside" of the bandwidth, so the weak signal won't be attenuated and it will be easier to hear it. That's basically what they are used for. If you're not into SSB, you don't need the SSB filter. If you're not into CW, you don't need the CW filter. Also, rather than Yaesu as a source, you may want to consider the following because of more favorable pricing and better operation. Inrad is OK also but I am not familiar with them. I am familiar with the following.

Go to W4RT: http://www.w4wb.com/

I suppose a 2000Hz filter could be better, but I'm not into SSB.
For SSB you need 2300Hz OPF-Y-SSB ($134)
Useful for filtering out strong signals adjacent to the signal you want to hear. Stops the strong signal from causing the attenuation of the weaker signal that you want to hear.

For CW you need 500Hz OPF-Y-CW-500 ($114)
OR 300Hz OPF-Y-CW-300 ($119)
Useful for filtering out strong signals adjacent to the signal you want to hear. Stops the strong signal from causing the attenuation of the weaker signal that you want to hear. The 300Hz filter is just a narrower bandwidth. Some people don't care for the 300Hz filter because they say it "rings" more than the 500Hz filter. People who are into contests sometimes prefer the 300Hz filter. Even though they are for "CW", they could be used for PSK also.

Last, the LDG FT-Meter

Also, at W4RT, check out the FT-Meter. I have one and it's the best $45 I ever spent. (radio wise)
It is back-lit illuminated with an external Power Module that doesn't come with it (I use a Wall Wart - 12VDC output). It plugs into the jack on the bottom of the FT-897/D, 2.5" from the right edge, near the front. You set what you want the meter to read by using Menu 60

(for when receiving) and Menu 61 (for when transmitting).

Finally

If you're into CW, check out the Straight Key Century Club (SKCC) (no dues yet)
http://www.skccgroup.com

29416. Home low power repeater?

Yahoo group: FT897 (2010)
Date: 2010-03-17 16:41:16 UTC
From: Wizzard
Topic: 29416 Message: 29416

My wife and I found out that there are many we can't hear locally on our 2M HT's from home. Slim Jim works fine, but a bit bulky :)(Bitterroot valley in west MT mountains). To that end, has anyone any ideas for creating a local low power repeater setup using the 897d as the main receiver/trans to allow the HT's to hear and talk back?

I thought of a 'spare HT' or inexpensive low power unit with vox-vox linking to the 897. That would let us carry our own HTs around the property, and local area, with a link to 146.580, or other simplex freq.(a frequency our local group usually uses.) I know, there's a local repeater here, that's not the route we want to go.

I understand that the DATA port on the back has pins that would be useful for repeater setup if you don't want to use VOX.

The Yaesu 8900 has this functionality built in, if you're willing to buy another radio. Not as flexible as the 897.

It's more normal to use completely different bands for the local side in order to make non-interfering antenna setups easier. If you use 2m and 70cm for example you can share an antenna between both units, using a diplexer to separate them. The 8900 has this built in.

29418. RE: [FT897] Home low power repeater?

Yahoo group: FT897 (2010)
Date: 2010-03-17 17:47:43 UTC
From: Dennis
Topic: 29416 Message: 29418

Richard has it right. However, there are several radios that would suffice. I have the 8800 and has same Xband capabilities also. You would be better served by going this route rather than having to spend more money for what you want to do, assuming you are ONLY trying 2m/70cm. The Kenwood TS2000 will allow this AND the capability to Xband into HF as well (if that is what you may like, too) among other features as well. But, at nearly $1700.00, it may be too much money for you to spend.

It IS possible, some say, to link two 897's together and make a repeater out of them, but I have no knowledge on how to do this. Supposedly the 857's have the same possibility too.

On the other hand, you could find a good low power repeater on ebay or somewhere, have it programmed and use that - just another idea, but again you could still spend around $300.00 or more.

Unfortunately, there will be NO "cheap" way to do what you seek!

Good luck!

Dennis - N8BMB

From: Tate Antrim
Topic: 29403 Message: 29420

Don't think about switching internally. The final PA for the HF includes 6m - it's very broadbanded. Use an external switch and maybe a couple of diplexers to route the 6m signals to the antenna on the same feedline as the 2m and 70cm

That's exactly what I've done with my Comet GP-15 tribander (6/2/440). An external switch and a duplexer (splitter). Just look carefully at the switch you're considering to make sure it handles the frequency ranges you need for each side of the switch. Unfortunately, most switches still seem to gang VHF/UHF/6M on the same side, which defeats the purpose of what you're trying to do. Get one that handles 160M through 6M freqs on one side and VHF and above on the other side (an expensive mistake otherwise).

What I've also found is that my 6m signal reports are much better on both Tx and Rx if I run the 6m through the (VHF/UHF) side of the switch rather than the HF side where the 6M is found natively in the radio.

There is no any efect on my 897D until 9.7V. If battery voltage decrease more, max. output power (100W) start to decrese also.
Anyway, if voltage on battery drop under 10.5V with full load, battery is already empty and you should stop to discharege more to avoid battery permanent damage.

FTBasicmmo is NOT free. You are running in demo mode. Eventually you will be required to purchase the program and get a key to unlock the program. I know, I have the program. However, you are correct that it is the easiest way to program the radio, however, you still need to know how to operate the basic functions of the radio and this issue is one that you SHOULD know. It is NOT rocket science. Simply reading the manual before operating ANY radio is sound advice because most questions an 897 owner may have can be answered there.

29428. RE: [FT897] Re: repeater operation

Yahoo group: FT897 (2010)
Date: 2010-03-18 19:31:48 UTC
From: Dennis
Topic: 29374 Message: 29428

No offense was taken and I apologize if my reply came off as gruff. However, if you haven't been in the group long I can assure you there have been way too many questions posted here that if the writer would have taken the time to read the manual, he/she would have found their answer. While most radios now ARE, for the most part, "plug and play", I do realize there will be questions the manual does not answer. As well, I DO realize the manual can be confusing since it either does NOT properly cover some things or is not written clearly.

I hope that you will not be offended and seek the help you may need in this forum in the future as there is excellent advice offered here. Again, I apologize if I seemed gruff!

Dennis - N8BMB

Just for the record, Dennis, I did read the manual. I just couldn't figure it out. Thought a newsgroup would be a reasonable place to post a question. Sorry if I offended you.

29429. RE: [FT897] Home low power repeater?

Yahoo group: FT897 (2010)
Date: 2010-03-18 23:17:17 UTC
From: af6cm_yahoo@myfastmail.com
Topic: 29416 Message: 29429

I agree with both Richard and Dennis, but I have another idea.

The best solution is using an FT-8800 (or similar) radio with cross-band repeat.

If you want the least expensive solution, then I would recommend creating a single-band simplex repeater. There are devices that connect to any 2-way radio that record and repeat. It can be rather cumbersome to use, but it works. There is a delay while the other party is being recorded, you may / may not hear this twice. No need for a duplexer, because it is simplex. You can use an inexpensive older HT with a j-pole (or slim jim) antenna, and not tie up your FT897. You don't even need CTCSS.

I don't have a source for one of these simplex repeater adapters. I bought one a long time ago from Radio Shack, but I doubt they still carry them. You can probably find one with a web search.

On Wed, 17 Mar 2010 12:47 -0500, "Dennis" <n8bmb1@...> wrote:

Richard has it right. However, there are several radios that would suffice.
I have the 8800 and has same Xband capabilities also. You would be better
served by going this route rather than having to spend more money for what
you want to do, assuming you are ONLY trying 2m/70cm. The Kenwood TS2000
will allow this AND the capability to Xband into HF as well (if that is what
you may like, too) among other features as well. But, at nearly $1700.00,
it may be too much money for you to spend.
It IS possible, some say, to link two 897's together and make a repeater out
of them, but I have no knowledge on how to do this. Supposedly the 857's
have the same possibility too.
On the other hand, you could find a good low power repeater on ebay or

somewhere, have it programmed and use that - just another idea,
but again
you could still spend around $300.00 or more.
Unfortunately, there will be NO "cheap" way to do what you seek!
Good luck!
Dennis - N8BMB

29430. Question regarding current consumption

Yahoo group: FT897 (2010)

From: yo5orw
Topic: 29430 Message: 29430

Hello.
I intend to install my FT-897D in my car and I'd like to use the lighter jack for supply. There is a 10A fuse on this connector. Anyone knows what should be the max power I should use (FM especially on 70cm, 2m and 11m CB)? I dont want to burn the fuse. Or shall I connect it directly to the car battery?
Thanks

Cosmin - YO5ORW

29431. RE: [FT897] Question regarding current consumption

Connect directly to the car battery.

Most cars these days have a huge rubber grommet to bring the power wire through.

Take apart a wire clothes hanger, tape the power cable to the hanger, push the

Hanger through the grommet. Once you get the power cable through the grommet,

Take the cable off the hanger. You can then route the power cable over, under,

Around, and through any obstacles to the rear of the radio.

You will not likely be able to run the 897D off the 10A fuse. The manufacturer recommends specifically

That you not do this. Shorting out things by drawing too much power can be a problem. OK, it's only

A lighter but most cars today have computer based systems. No point in jacking with this.

If you run the power cable from the battery, you'll have all the power you need for any frequency.

Bruce, AE6VG

It's the kind of thing that can be done well in software on a general purpose computer, especially as such a computer is going to have plenty of storage to buffer the recording.

It sounds fiddly to use though, especially if you don't know whether or not the other party is still in range or still transmitting or if there is a danger of doubling.

Current draw up to 50W should fit in, all going well. The main problem with using the lighter is that it's a weak connection to a poorly filtered supply. Connecting straight to the battery gives you a strong connection to the battery itself and its quite effective voltage stabilising ability.

I use Powerpole connectors, which are a bit overkill for the current in use, and have a lead with a powerpole from the car battery to the compartment where the radio is. This lets me swap radios in and out or use the radio in various places.

29434. Re: [FT897] Question regarding current consumption

Yahoo group: FT897 (2010)
Date: 2010-03-19 10:46:37 UTC
From: josedouglas@yahoo.com
Topic: 29430 Message: 29434

I was just looking into this last week, the owners manual on my 04 Government Motors Sierra Pick Pick up truck gives no mention on the max amt of current you can draw from the power point.
The manual on my 05 Lincoln Town Car does, it says it comes with a 10amp fuse but all you have to do is change the fuse to either a 20amp or up to a 30amp depending on what you want to use.
It does warn not to use the cigarrette lighter itself for powering things or vice versa.

Still might be better to connect directly to the battery though...

Cheers and 73s from Mid Coast Maine,

Jose, are you saying that it says in the owner's manual for your Town Car to just change the fuse if you want to draw more power? I really would think they wouldn't say that. After all, the fuse is there to protect the wiring of the car, and is probably sized accordingly.

The best power hook up is definitely to the battery, using the accessory connection only for temporary hook ups.

73,
Ken

I'd say get one of those hokey "repeaters" that MFJ and the rest make.

It's basically a recorder on a chip. Once you talk, the recorder starts. When your done talking, it repeats whatever's been recorded through the mic input (usually).

Search "Simplex Repeater Adapter" or something similar. You'll find LOTS of into out there on these setups.

The downside is this: It listens, then retransmits. NOT real time.

From: Bob
Topic: 29437 Message: 29437

I just received my 897d from Gigaparts and it is a great little radio. I am mainly going to use mine for 6 and 2 meters and as a back up to my FT950. I am using a Md100 on it right now and getting good audio reports. I thought about selling the md100 and buying the mh59 mainly for control on 2 meters. I've seen mixed reviews on this mike on HF. Has anyone used one on HF and do you think it is worth the money?

Thanks and 73's

Date: 2010-03-17 22:13:55 UTC
From: John Geiger
Topic: 29438 Message: 29438

I have for sale a brand new 75 foot run of Times Microwave LMR-LW400 low loss coax cable with N connectors installed. This would be perfect for the 2m/70cm side of your FT100D or FT897D. LMR-LW400 is Flexible Low Loss Communications Coax. The LW series uses a copper clad aluminum shield for a 30% weight savingsover standard LMR (which is already lighter than many similar coax).

You can read more about it at

http://www.yachtwire.com/webstore/index.html?190.html&1

It sells for $1.60 a foot, I will sell this coax run for $85 shipped in the US, and can take paypal/check/MO.

Hello Fred,

I had a 04 Exterra that I put a 857d in. I mounted the main body of the radio under the passenger seat and remote mounted the head on the dash. The Nissan had a lot of computer and fuel pump noise. I grounded all the doors, the back hatch and hood and the exhaust system. I put torroids on the ignition wires and fuel pump wires. I used the internal DSP and a SGC DSP speaker and it was still terrible. I finally gave up and took the radio out. Maybe you won't have this exprience but mine was a nightmare.

From: starski6
Topic: 29442 Message: 29442

Hello to all, this is my first post here.

I recently noticed that my main dial seems to have a dead spot at the 5 through 8 o'clock position. The tuning value 'hangs' between these points, then continues to tune fine for the rest of the turn, until getting back to the dead spot.

Happens on both VFO's and in both directions. Happens with the mic plugged in and unplugged....

Yaesu said to do Master reboot of radio and tuner. Got the radio, unclear as how to get the LDG tuner...

Any thoughts before I send it off to service?

You don't need any utility to do that, just set the mic (or line) input to be a playback device.

Check to see if it affects other uses of the VFO knob, such as changing output power, etc. A couple months after I bought my unit, I started having the same problem. It affected any use of the VFO knob. It got gradually worse until the knob had no affect at all. I sent it in for warranty service. Turned out the optical encoder unit for the VFO knob had gone out. My bet is that is what your problem is.

Also, just to keep things legit, you may want to sign your post with your name and call.

My own 2001 GMC 200HD has two auxiliary power plugs alongside my cigarette lighter
plug. The auxiliary power plugs are fused for 20 amps. They handle the power demands
of my 2 meter rig fine, though I've generally stayed at 25 watts or less.

Topic: 29430 Message: 29448

Ken,

I guess it's up for interpretation, here is what is says:

"The maximum power each power point can supply depends on the fuse rating.
For example: a 20A fuse should supply a maximum of 240Watts, a 15A fuse should supply
a maximum of 180 Watts and a 10A fuse should supply a maximum of 120 Watts.
Exceeding these limits will result in a blown fuse."

The car comes with a 20A fuse for the power point, so as is it should be OK for up to
240Watts.
I have no plans on running our FT-897 on a vehicle, but might consider running our Kenwood
271
2 metre rig.

Thing is, we're really not traveling much presently so probably won't be doing it for a
while.

Jose, are you saying that it says in the owner's manual for your Town Car to
just change the fuse if you want to draw more power? I really would think
they wouldn't say that. After all, the fuse is there to protect the wiring
of the car, and is probably sized accordingly.

The best power hook up is definitely to the battery, using the accessory
connection only for temporary hook ups.

From: jraboldcal
Topic: 29416 Message: 29450

There have been several mentions in this thread of using a crossband repeater (for example, 440 to 2m) in your situation. Part 97 imposes rules on repeaters that can be hard to meet for these setups without either add-on equipment or having a licensed control operator physically sitting at the repeater while it is being used. If you're an ARRL member, go to the ARRL home page and search for "crossband". The members-only documents named "How Are You Controlling Your Repeater?" and "Crossband-Repeater Operation" are worth a look.

From: Richard Corfield
Topic: 29416 Message: 29451

It would vary by country. In the UK on the odd occasion I've cross-banded I've either been out with RAYNET which is a special case, or I've taken it as "operating the radio by remote control using a low power signal in another amateur band". The 2E0 licence allows that as long as you keep your controlling radio's power at 500mW or below. The full licence (M0, G) allows more freedom.

I've felt reluctant to use cross-band because it is taking up two frequencies. Presumably I should make routine announcements on both frequencies, which is quite easy to do. Still, if someone comes in on either of the frequencies in use they appear, possibly unwittingly, on the other one. With the VX-7 handheld I can monitor both frequencies at once which would tell me if my repeater was transmitting something I didn't intend it to. I can also call back on the appropriate channel to talk to the other amateur.

I've tended to avoid using CTCSS on the basis that if someone hears a conversation on the control frequency they may wish to call back, and CTCSS will make that harder. I don't know the licensing position if they reply to the person I'm talking to through my repeater without knowing it's a repeater and wish to continue the conversation. Keeping control uplink and downlink power as low as possible reduces the chance of interference, but does not prevent a strong signal on the control frequency from someone who does not know you're there because your signal is kept weak. If they follow the standard procedure "Is this frequency in use" it should help prevent this. Writing this I'm starting to think I should use CTCSS because difficulty replying is less a problem than unintended use.

The low control power does keep the operator close to the repeater, so shutdown is easy. I understand this is an aim with the licence conditions. I once met a friend while out walking with the radio and said I'd have to keep the radio on because of the repeater and my duty to monitor it. Some repeaters allow remote shutdown and restart by DTMF which would have been helpful here. It would be a nice a little microcontroller project to play with one day to allow an emergency remote shutdown. (I've also explained out walking what amateur radio is and what RAYNET do which was quite useful. A group of kids asked what I was doing.)

I'd add a disclaimer though - I'm not part of Ofcom or RSGB or anyone who actually really knows about this. This is based on my interpretation of the licence conditions.

Jose (and Ken),

I don't want to disagree with you; however, you can't assume that just because a 20A fuse (at 12 Volts nominal) yields 240W (this is a basic electrical calculation by the way, you don't need a manual) - that you can run a 100W HF rig on it. If you look at the manual for the FT-897D (Available for free download from Yaesu.com), it clearly states that the rig draws 22A during transmit. So you better have at least a 25A fuse if you want to run full power.

Also for the record, when they design the car, they size the wire for the current they intend to run across it. If they fuse it for 10A, they typically would use the smallest wire they can that will safely handle 10A (it's a matter of keeping the cost as low as possible). SO if you try to up the fuse to 20A, the wire resistance will cause the wire to get hotter than normal and may cause a fire. My strong recommendation is use the same fuse the manufacturer used. If that is not enough current, then run direct to the battery. And make sure YOU use large enough gage wire to carry 22A for that distance. If you don't know what gage wire you need, either ask an electrical expert, or do some research on the internet.

Joel,

You might want to put a meter on it when you transmit. According to the FT-897D manual, the current consumption for the rig is 22A during transmit (at full power), and there is no stipulation that it is any lower on VHF or UHF. If in fact their specifications are correct (I'm guessing they are pretty close since they build the rig), then it is a matter of time until you blow the fuse (or worse until you burn up the wiring from too much heat due to the extra resistance).

Mike,

I was just stating what the vehicle's owners manual stated.
A good friend of mine wanted to hook up a Kenwood T-271 - 65Watt 2 metre rig in his X-Terra and was
having trouble finding out how to bring in the wiring to hook it up to the battery.
I suggested he could hook it up to the Power Point, since he was only thinking of running it at 25 Watts (rig has
only two power options, 65 and 25).
He finally decided to take it somewhere and have it hooked up to the battery.

Personally, as I had mentioned earlier, I have no intention at this time to hook up a rig to any of my vehicles and see doing that as an emergency measure only.

I agree with you that the capabilities should be chequed out first before going out and hooking up a rig to a vehicle's Power Point.

Cheers and 73s,

Jose

So I turned on my FT897D last night and after a minute or so I had a gradually building intermittent crackling noise on receive until it was continuous S9, all bands. I disconnected the antennas and the noise remained, so an internal issue apparently. I powered it up today and at first no noise, but it again appeared gradually after a few minutes. Anyone experienced anything like this? Receiver front end damage of some kind? I expect I'll be shipping it to Yaesu on Monday, but sure would like to hear the group's thoughts.

Thank you. The Warranty is expired... Should the radio go back to Yaesu, or to a trusted shop? Any suggestions?

29461. S9 noise with no antenna attached

Yahoo group: FT897 (2010)
Date: 2010-03-20 21:45:37 UTC
From: Phil
Topic: 29459 Message: 29461

Pete,

It sounds like the problem I had with my FT987D that I purchased used (got Burned). I ended up sending the radio back to Vertex for service and they replaced some ceramic filters. Apparently they have seen this problem before. It was about a 2 week turnaround. Vertex should be able to fix you up.

Good Luck,
Phil - K3FOD

If you have a shop that you have worked with before, you could check with them. Otherwise, you would be best off to ship it to Yaesu. You might want to check with Yaesu, it's possible that the optical encoder ass'y. is a plug in module that you could change out yourself. I've never explored that deeply, so I can't tell you.

Best of luck on this, Tim. Keep the list posted as to your progress/results.

73,
Ken

From: yo5orw
Topic: 29459 Message: 29463

Hello Pete.

I had the same problem with my FT897D. Noise appeared on all bands with or without antennas connected. Seems that the problem is caused by one or more ceramic filters on Rx (probably ceramic filter CF1005 - see the service manual). I sent it back to the dealer.

Good luck

Cosmin - YO5ORW

29464. Re: Question regarding current consumption

From: yo5orw
Topic: 29430 Message: 29464

Thank you all for the answers/advices.
Since it's safer, I will connect it directly to the battery using the same wire size as the rig's. With the cigarette plug it's easier to install/uninstall. For safety reasons I'll add a switch on the wires.
I'll keep the engine on when running full power hehe
Thanks

29465. FT897 Key Clicks

Yahoo group: FT897 (2010)
Date: 2010-03-21 14:31:10 UTC
From: g4fal
Topic: 29465 Message: 29465

Hi

My FT897 (not D) is generating bad key clicks on cw. These have been commented on by other stations. They are probably worse than FT1000MP clicks.

Does anyone else have this problem and if so is there a published mod to fix it? I can't find anything through the search engines.

Of course is may be that the radio has developed a fault. Has anyone experienced this?

73 Nick

29466. Replacement knobs

How about from Yaesu (Vertex Standard)? You can get the part number(s) you require from the technical supplement/Technical manual.

There has been previous discussion about that knop on this board and apparently they can get broken off relatively easily with a hard knock so check that the shaft is still intact and not broken off.

I haven't had to change the optical shaft encoder on my FT-897D yet but I did on a Ten-Tec Argonaut V. It was soldered in but it was like working on a washing machine. Today's rigs are mostly empty space so it might be worth looking into doing it yourself. Just be sure to use electrostatic discharge precautions whenever you pop the lid open.

Hi Nick,

No, I haven't detected this problem with my FT-897D. I'll be curious as to what you find out. How did you monitor your rig to hear the key clicks? As you probably already know, make sure the noise blanker is off on the monitor receiver before checking for key clicks otherwise it will create clicks for you if the signal is strong enough.

Pete,

What is the noise with the receiver terminated with a 50 Ohm dummy load? The noise could be coming from a switching power supply if you are using one. All bets are off if the receiver antenna connector is left open. Without more information your FT-897D noise does sound unusual.

From: agentdurden2002
Topic: 29473 Message: 29473

Hello everyone,

I have an FT-897D that's got memory retention issues.

When first powered on it displays:

MTQMB PKT 0.00

By pressing V/M it will change to:

M-001 LSB 7.000.00

If I rotate the main dial it changes to MTUNE and the frequency changes.
If I return to the M-0001 LSB 7.000.00 screen by pressing V/M and then rotate the MEM/VFO CH knob the radio freezes. The little running man stops running and all front panel buttons cease to function.
Power off can only be achieved by removing power.

Add the to above that the voltage display display 0.0v and although can be changed using Menu 017, its setting along with all other settings is lost once power is removed.

Any clues as to why this is happening?

Topic: 7593 Message: 29476

Hi Iain,

With only the DSP filter, strong signals outside the DSP filter's band width but inside the IF filter's band width will "pump" the AGC causing the signal you are listening to be modulated by the interfering signal (even though you don't hear it). This can be corrected somewhat by turning back the RF Gain (raising the AGC voltage) and compensating by turning up the AF Gain. This technique works well with only the DSP filter and restores the original dynamic range of the signal. It only needs to be turned back to the point where the S-meter doesn't fluctuate with the interfering signal.

With a narrow IF filter you won't have this problem but there is a bit a phase delay through the mechanical filter. This causes the AGC to react more slower and can cause a slight pop at the beginning of a CW signal. In most cases you won't notice the effect.

In short you can get by pretty well without the narrow IF filter if you ride the RF Gain control but I think the filter in general is worth the expense if you are a serious CW operator.

Iain-

Filters

The question really is "what do they do", and do you NEED what they do. The filters provide a narrower receiving bandwidth. You may be trying to receive a weak signal. If there is a strong signal close to the weak signal, then the strong signal will cause attenuation of both signals, and it will be hard to hear the weak signal. If you have a narrower receiving bandwidth because you are using a filter, you can tune in the weaker signal and the stronger signal will be "outside" of the bandwidth, so the weak signal won't be attenuated and it will be easier to hear it. That's basically what they are used for. If you're not into SSB, you don't need the SSB filter. If you're not into CW, you don't need the CW filter. Also, rather than Yaesu as a source, you may want to consider the following because of more favorable pricing and better operation. Inrad is OK also but I am not familiar with them. I am familiar with the following.

Go to W4RT: http://www.w4wb.com/

I suppose a 2000Hz filter could be better, but I'm not into SSB.
For SSB you need 2300Hz OPF-Y-SSB ($134)
Useful for filtering out strong signals adjacent to the signal you want to hear. Stops the strong signal from causing the attenuation of the weaker signal that you want to hear.

For CW you need 500Hz OPF-Y-CW-500 ($114)
OR 300Hz OPF-Y-CW-300 ($119)
Useful for filtering out strong signals adjacent to the signal you want to hear. Stops the strong signal from causing the attenuation of the weaker signal that you want to hear. The 300Hz filter is just a narrower bandwidth. Some people don't care for the 300Hz filter because they say it "rings" more than the 500Hz filter. People who are into contests sometimes prefer the 300Hz filter. Even though they are for "CW", they could be used for PSK also.

Next, the LDG FT-Meter

Also, at W4RT, check out the FT-Meter. I have one and it's the best $45 I ever spent. (radio wise)
It is back-lit illuminated with an external Power Module that doesn't come with it (I use a Wall Wart - 12VDC output). It plugs into the jack on the bottom of the FT-897/D, 2.5" from the right edge, near the front. You set what you want the meter to read by using Menu 60 (for when receiving) and Menu 61 (for when transmitting).

Finally

If you're into CW, check out the Straight Key Century Club (SKCC) (no dues yet)
http://www.skccgroup.com

Yahoo group: FT897 (2010)
Date: 2010-03-23 17:33:47 UTC
From: radiobuff777
Topic: 29466 Message: 29481

Similar situation happened with my FT8800. The knobs are very flimsy, actually, the brass stem attached to the potentiometer is the culprit. Anyway, I ordered new pots and knobs (although it later occurred to me that I didn't need the plastic knobs, they were still good, but I didn't think when I ordered the. It's OK, I have extras now in case I lose one).

My son knocked the radio off the shelf and it landed on its face, damaging both knobs. I still haven't gotten around to repairing it yet, but I ordered directly through Yaesu. Once you get the right person on the phone, they are very hlpful. Good luck.

I have the FT-897D with the MD-100A8X desk mic. How can I get DTMF tones into my rig so that I can connect to echolink repeaters? I'm not going to replace the desk mic with the dtmf hand mic just for the tones. Is there an external dtmf device that can be used? Thanks in advance for any help that you can provide.

Hank / KB4MTO

If you are ins your shack and have a computer, why not just use the computer for echolink.

It is easier and works better.

IRLP wants you to go from RF to IRLP to RF but Echolink does not.

Works very well computer to computer. Every thing is done with the mouse .

I do use keyboard to keyboard. I also use a headset with the echolink software and have fun with it as well. I am now wanting to take it to the next step and connect to the local repeater with RF and hop around.

I am looking at the Pipo dtmf encoders, but have no idea how to integrate one into the 897. Anyone have any ideas?

Get the Yaesu or Vertex tt mike. MH-36E8J or MH-59A8J remote mike.
Plug it in and use it.
The Pipo is going to be a big hassle hooking it up.
I use the remote mike. Lets you do a lot of other fun things.

Larry,

Yes there is, I bought mine from buxxcomm.com out of Virginia.
I have the part number up in the shack, I can get it for you if you want.
It was about $20 plus shipping.

Also, if I recall correctly, I had to change the "CD" command on the tnc from "internal" to "software"
for it to work correctly.
I don't have the FT-897 currently set up for packet though, as I'm using a Kenwood TC-271 for that purpose.

Cheers,

Jose Douglas

Hello Hank,

I also have tried echolink 0n my FT897, with the fist mike and the MD100,, It is no problem to set up the required CTCSS, for each repeater, and save in memory,,,, but as you say, I also had a problem with the DTMF tone on transmit to access,,, What I was recomended was to insert the tone , by holding the DTMF "key pad" to the front of the mike, and pressing the buttons as required.

As I was only testing out our new echolink facility it was no bother for test purposes,,, but I am investigating opening the DTMF kepad, and making a hard wired cnnection to the mike audio,which will allow me key the mike, and key the tones without the hassel of holding the tone pad [digital dialer] up to the mike.

Have'nt tried it yet but should be simple enough. I played around with constructing a pcb for generating tones,,, but not worth the hassle,,, the digital dialer pad was $10 [euro] and I will try to link it into the mike audio.

Hope you can find a fix soon.

From: Danny Loyd
Topic: 29491 Message: 29491

Hello everyone,

I am looking at getting either the Heil HC-BM-10-4 (i believe those are the numbers) or the 10-5 for use on my 897D. Has anyone had any experience with either of these headsets? Also planning on getting the foot switch.

Thanks for any advise on this. I know it has probably been discussed before but want fresh ideas.

Hi Hank,

if you are using a standard DTMF pad, check out the specs of the chip in it. Most of them have the facility to be able to have it key something when you press a button, all you have to do is make up the interface. I did this in my car where i have a fixed, boom bicrophone (Icom HS15 from memory) and have the output from the DTMF mixed woth the microphone input. I can then select to have the DTMF pad also trigger the PTT if I want (for other control functions) of for it to be operated from the normal PTT for when using Echolink or IRLP.

There are also other alternatives such as DTMF generator programs which you can download and then use your computer to generate the tones.

Danny,
I have many products from Heil. I do not have the BM's but I do use the Traveler headset and the Proset Plus with my 897/817 and even my VX7 HT. (I also have some hand michs) I have both the foot switch and hand PTT. I can tell you that all work very very well and I do get nice reports on both signal and audio. I will never go back to the stock mic. Also if needed, the support is top notch. Just a phone call. You won't go wrong, believe me.

Years ago my employer recommended all international travelers carry a little device known as a Pocket Tone Dialer to make international calling easier. These handy little devices used standard DTMF tones and had memories that stored strings. You held the dialer against the phone and hit the appropriate memory button. If I remember right, I think you could store a string of > 24 digits and it had about 30 memories.

This could be a quick easy solution to your problem. Mine was a Radio Shack - about $10-15 I think. Google Pocket Tone Dialer. 73,

The technique I've used is to use my sound card interface to have the computer do the dialling. It's a little heavyweight if you don't already have a computer and a sound card interface though.

From: vanzwetselaar
Topic: 29499 Message: 29499

Dear OM's

I am not sure if anyone else came with this problem but I can't get a frequency reading or change in MIXW2 or Hamradio de Luxe.

I am using the SB2000 from cgantenna as interface. The connections are made with the cableset which was supplied with the SB2000 and FT-897. CAT (via AT-897), DATA and PTT to the FT-897, audio in and out to the laptop.

Receiving works, I can read CW or PSK etc but no frequency reaction in both programs. Superbrowser works in Hamradio.

Menu 19 = 9600Baud and so are the programs settings
Menu 20 = Off
Menu 85 = CAT

Is there more to set in the menu's? Anyone who solved this problem?

Thanks!

Years ago my employer recommended all international travelers carry a little device known as a Pocket Tone Dialer to make international calling easier. These handy little devices used standard DTMF tones and had memories that stored strings. You held the dialer against the phone and hit the appropriate memory button. If I remember right, I think you could store a string of > 24 digits and it had about 30 memories.

This could be a quick easy solution to your problem. Mine was a Radio Shack - about $10-15 I think. Google Pocket Tone Dialer. 73,

From: Jeff
Topic: 29499 Message: 29502

Try removing the AT-897 from the equation. Plug the CAT control cable from your interface directly into the CAT port on the radio. If it works, then it's something in the AT-897 that's preventing it from working.

I have an older, first-generation AT-897 and it only intermittently passes-through CAT commands as it is supposed to. I believe a firmware upgrade (new main logic IC) to the tuner may have addressed this issue, but my unit is so old that it's not upgradeable.

Danny,
I have many products from Heil. I do not have the BM's but I do use the Traveler headset and the Proset Plus with my 897/817 and even my VX7 HT. (I also have some hand michs) I have both the foot switch and hand PTT. I can tell you that all work very very well and I do get nice reports on both signal and audio. I will never go back to the stock mic. Also if needed, the support is top notch. Just a phone call. You won't go wrong, believe me.

Yes, call me "educated" now - it wasn't the knob, it was the shaft, and
once I got my nice new replacement knobs I realized the issue immediately.

Anyone know how hard a repair it is to replace the pot?

How cheap can they get - I mean come on, a plastic shaft???

Wow!

From: Eric van de Weyer
Topic: 29466 Message: 29506

Hi Tom,

Have you ever thought that it may be done that way for a reason?

Imagine that the same accident befell your radio and it had a metal shaft, the possibility is there that rather than just breaking off the shaft it actually bent and mangled things inside the radio. That could end up being a very costly repair instead of simply having to replace one pot or switch.

Remember that this radio is designed for portable use where it could quite easily sustain knocks and bumps. I think they did the right thing, whether it was planned that way or not.

73....Eric VK2VE.

You can also make a cable if you have the inclination. You need a 9 pin male serial plug, a 6 pin mini DIN plug and a four conductor cable. Its a PITA, but when you're done, you're done. And it will work with the ICOM mini DIN data ports as well without modification.

From: Hank
Topic: 29466 Message: 29513

While following this post I figurd it was just a weak spot in the radio. But I think you might be onto something, breakaway knobs so to speak. If the shaft was strong, it could actually punch or rip the switch off of the board if it hit just right. Replacing a switch or knob is much cheaper than a main board.

Dear OM's

I am not sure if anyone else came with this problem but I can't get a frequency reading or change in MIXW2 or Hamradio de Luxe.

I am using the SB2000 from cgantenna as interface. The connections are made with the cableset which was supplied with the SB2000 and FT-897. CAT (via AT-897), DATA and PTT to the FT-897, audio in and out to the laptop.

Receiving works, I can read CW or PSK etc but no frequency reaction in both programs. Superbrowser works in Hamradio.

Menu 19 = 9600Baud and so are the programs settings

Menu 20 = Off

Menu 85 = CAT

Is there more to set in the menu's? Anyone who solved this problem?

Thanks!

In mem mode: change to 'k' This is where all of the mem limits are stored.
They are stored in pairs. An upper and lower limit.
Change the 'A''B''C' buttons to b the one where 'B' is Skip. This button
will toggle the skip/non-skip status. Toggle off the band pairs your not
interested in and On the pair you are. I think I learned that the lowest
pair toggled will be the pair the radio scans. You don't have to be in the
band you want to scan, that has no affect whatsoever.

If you have some radio mem programming software, this will be a bit
easier. If not, just make a chart of HF + 6M bits you care to scan. I
don't believe V/UHF works. (At least my flaky memory seems to think that)

Francis,

I had the same problem as you have and wondered sometime before finding out:
just define your 5 pms limit bands and that's it.

Whenever you want to scan restricted by PMS, switch PMS on, and tune the
freq with the MEM/VFO CH knob to the band you want. Your PMS limit will
adjust automatically to the one corresponding to the band you just tuned in.

29523. CAT cabling

Yahoo group: FT897 (2010)
Date: 2010-03-28 05:28:09 UTC
From: n3kma
Topic: 29523 Message: 29523

Good evening, all!

I have a question about cabling. I bought an FT897 and the matching auto tuner that fastens on the side of the radio. To control the tuner, Yaesu uses the CAT port. The down side is that I can't not hook up my netbook and Ham Radio Deluxe to my radio. Is it possible to get a Y cable to allow 2 items to use the single CAT port?

DE N7UVL,
By your limited description, you must be referring to the
Yaesu FC-30, which has only the one CAT Port. Not the
LDG AT-897, which as a "pass-thru" CAT Port?/ga
.

Hi Fred,

All is not lost,

If you go to menu 59, you can set that to CAT and then you have the CAT connections coming out on two of the microphone pins. You just need to get or make a splitter cable for that one then and you can se the mic connector for your CAT input.

Of Course, if you are using the MH-59AhJ remote control Microphone, then you are snookered as it uses those pins for its control functions.

73....Eric VK2VE.

Fred-
That's what I thought. In your previous message you said you "... bought ... a tuner ... '. Was this recent enough that you could take it back if you wanted to? Here's why I mention this.

The Yaesu tuner works but it seems to not tune well if the initial SWR is greater than 3:1 Also, it "uses" the CAT port and you therefore can not connect anything else to the CAT port.

Alternatively, many people have selected the LDG AT-897 Autotuner. While not as aesthetically pleasing as the Yaesu tuner, it also mounts on the FT-897 radio. However, its advantages are that it can handle initial SWR up to 10:1, AND while it plugs into the radio CAT port, it HAS a CAT port on the back of it (it only uses the CAT port for power). Therefore this CAT port is available for other equipment.

To check this out, go to http://www.w4rt.com Click on Yaesu Accessories, then scroll and click FT-897/D, then scroll and click AT-897 Autotuner, then click on the picture of it.
WOW!! THEY'RE ON SALE FOR $169 RIGHT NOW!! But the ad says there are only two left at that price!

Go for it- 73 Carl WZ4CW

I actually bought both pieces from the same person on ebay. I can just put it back up for sale. I'm not thrilled that it won't tune a piece of wire since it's so portable and you're most likely to have a piece of wire if you're operating remotely.

Thanks for the information. I appreciate it.

Hi Fred,

I'm not certain whether the reply I sent yesterday made it through as I was having some internet issues.

There is another option and that is that by using menu 59 to set the microphone, provided you are not using the MH-59 remote control microphone, you can set it to CAT and you then get the CAT port available through the mic connector on the front panel.

There is probably a cable available to bring this out but it shouldn't be too difficult to make one up yoursenlf if there isn't. I am about to make one myself for a different reason.

73....Eric VK2VE.

You need to make sure that the cable is seated all the way into the connector. Most cables have the plastic surrounding the plug and that plastic usually prevents the plug from going all the way into the connector on the radio. You may need to trim that plastic a little to allow the plug to seat fully into the radio.

Subject: [FT897] CAT CONTROL

Dear all,
My FT897 does not communicate with computer i.e does not display frequency while running programme like MIX W OR WIN EQF logging programme.I use CT 62 cat cable.I have two of them.None is working.I think the CT 62 cables are not broken but some thing wrong with the radio.Please help me and guide me.Thanks in advance. DR.KHALID (AP2DKH)

Thanks for your reply.The cat cable is plugged in perfectly.
13.8 VOLTS are also present on one of the pin of cat/linear jack.
The jack connections on the PCB are all OK and resistance on txd and rxd pins are ok on the pcb.Please help me to diagnose the fault. Dr.Khalid de AP2DKH

I have had this problem when I forget to set the Baud rate to match the program. It is one of the menu items on the FT-897, and is usually set to 9600 baud. Most of the programs will not auto-match; we have to do it manually.

29543. RE: [FT897] Re: CAT CONTROL

Yahoo group: FT897 (2010)
Date: 2010-03-29 15:57:59 UTC
From: Mike Ernst
Topic: 29538 Message: 29543

DR.KHALID,

First of all you indicate your cables are CT-62. A CT-62 cable has a DB-9 serial port connector on the PC end. Is that in fact what you have, or do you have the USB version?

In either case if you go into devices on your PC, and look under ports, you will find a comp port that is the one connected to your radio. You must make sure the COM port number matches between this setting and the one used by the software program. You must also make sure the Baud rate listed there matches up to the software program and to the Baud rate in your FT-897D. And you must make sure the flow control there matches up with the program settings. (I prefer to select none under flow control and then uncheck both of those options in the software.)

I hope this helps - in about 90% of the cases where people have trouble connecting the PC to the radio, it is usually a mismatch between the settings in these three locations.

73,

Mike, AE8U

Dear Om's

Is it possible that there is a problem with the CAT port, perhaps an electrical or electronical problem? A fet that is fault? How can I chech that? Could a reset of the software do some good?

Hi Dr Kahlid,

The other thing to check, of course, is that the port is, in fact, set to CAT or ATAS and not Linear or Tuner as one fo these uses the CAAT pins for something else. If you need the rear port set that way then you can use the microphone connector to access the CAT port by setting menu 59 to CAT, so long as you aren't using the MH59 remote control mic.

73....Eric VK2VE.

29549. Display FT-897

Yahoo group: FT897 (2010)
Date: 2010-03-28 18:36:39 UTC
From: alfredaopinheiro
Topic: 29549 Message: 29549

Hello to all of the group.
I have a FT-897D, with 1 year of use, some days ago began to appear some stripes, as if they were defective in the display, the strips are vertical. Did some of the friends already see that problem type?
Wayner
Rio de Janeiro

29550. Re: Display FT-897

From: jabiru120
Topic: 29549 Message: 29550

Hi Wayner,
My LCD display, at about 12 months old, developed a single horizontal "dead" strip. I returned the radio to Yaesu (Australia) and it was fixed under their 3 year warranty.
I wonder if this is a common fault?
Regards
Rick VK4NR

Dr.

Have a look at this web page and follow its direction to help solve the problem.

29552. Ft 897, Signalink USB, Fldigi on Linux (Debian): Transmitting Issues.

Yahoo group: FT897 (2010)
Date: 2010-03-30 03:27:43 UTC
From: gbongi1
Topic: 29552 Message: 29552

I posted this in both signalink and ft897 yahoo groups. i hope the moderators are ok with that.

Ok I have been working on trying to tx on digi for some time now. I am embarrassed to say how long. I keep trying and failing to TX.

Finally I am trying to reach out for help.

First I will give you my set up, configurations.

OS: Debian 5 (Kernel 2.6.26-2)
Digi Software: Fldigi
Rig: Yaesu ft 897
Tuner: LDG 897
Interface: Signalink USB (I am the second owner. I am starting to wonder if I need to send it in to be checked out.)
Originally I made my own interface cable for signalink to Rig. I also used supplied Jumpers.
Since I have never been yet able to to transmit I have bought both a Jumper module and the 6 pin data cable from tigertronics and now have them both installed.

Rig Configuration:
Yaesu FT-897 in
Frequency = 14.070
mode = "dig"

Menu 036 Digi dsp = +1500hz
Menu 037 Digi gain = 20
Menu 038 = user-u
Menu 039 Digi shift = +1500hz
Menu 040 Digi vox = 20
Menu 075 RF power = 40
Menu 088 Vox gain = 1

CAT communication working on Multiple Ham programs and hamlibs on the CL

I can receive no problem

Symptoms.

I send a CQ and the digital software application (fldigi) initiates the PTT on on Signalink (red light). Also the PTT is executing on the rig (red light).
Fldigi "shows" in the waterfall that a tone is being transmitted. I hear sound through the monitor on the Signalink.

Everything "looks/seems" as thought I am transmitting.

However, I see no pwr or Modulation during transmit.

Any Ideas?
All Help and information will be greatly appreciated.
If you need me to be more descriptive or think I am missing something please don;t hesitate to ask for more information.

Here are my settings with a FT897D, a SignaLink USB, fldigi3.20.0b8 and Ubuntu Karmic 9.10
:
36 OHz
37 30
38 PSK31-U
39 OHz
40 50
75 100
88 50
And the total system works nicely.

Thanks for the reply. tried all of your settings except for you rf power setting (11 is a bit high yes?)

And still the same issue as I have written previously.

Thanks a lot

75 set to 100 (the maximum): I have read that recommendation in many posts, I adjust the power radiated by the tranceiver by turning slightly the Tx Knob of the SignaLink box (around 7 to 8 o'clock, not more, in order to see NO ALC deflection on the FT897D screen. This was just to answer your last question but it seems obviously that I did not respond to your first post.

From: john_kb0ne
Topic: 29549 Message: 29559

Hi,
Try going into the menu and adjusting the CONTRAST for the LCD. Otherwise, like the other post said you may have an LCD panel problem and need to replace it.

From the manual:
LCD Contrast
If you experience difficulty in reading the main display,
try adjusting the LCD's contrast, using the Menu mode.
1. Press and hold in the [F] button for one second to
activate the Menu mode.
2. Rotate the MEM/VFO CH knob to select Menu
Mode No-042 [DISP CONTRAST].
3. Rotate the DIAL knob to adjust the contrast. As you
make the adjustment, you will be able to see the effects
of you changes.
4. When you have completed the adjustment, press and
hold in the [F] button for one second to exit the Menu
mode

One thing that you said in your original post that caught my eye, your Cat communication is working on other programs. The Signalink must be plugged into the data port not the CAT on the FT897 to modulate the signal if I am not mistaken.

Right my original post states I am using the 6 pi din from signalink to Rig. I was just adding theinformation that CAT was working.

The signalink is plugged into the DATA port (6pin) on the back of the Rig

thanks

29562. Distorted audio on AM TX

Yahoo group: FT897 (2010)
Date: 2010-03-30 19:30:01 UTC
From: graham787
Topic: 29562 Message: 29562

Everything is fine .. except it seems AM tx ..Carrier is 25 watts , but the TX audio is very low and what there is, is quite distorted, unless at a very low level .. peak power meter reading remains at 25 watts during modulation ..possibly slightly negative

Tx audio on all other modes is fine .. no rf feed back etc , just the same on the dummy load ...

Anyone seen this , any ideas as what to check ?

Tnx - G.

29563. Re: Distorted audio on AM TX

Yahoo group: FT897 (2010)
Date: 2010-03-30 22:28:58 UTC
From: Steve Yates
Topic: 29562 Message: 29563

If you're using the stock mic put the switch to number 2 on the back and maybe use the high pass DSP function on transmit to minimize the bass response. To much bass on AM seems to rob power from the carrier causing distortion.

Unfortunetely poor audio is sometimes a characteristic of low level modulation on these modern "rice boxes". That is, AM is produced at an early stage and then amplified linearly until it is transmitted. An AM only rig, like a CB radio, on the other hand will usually have high level modulation of the final amplifier with much better results. There is a cost associated with having a rig that tries to do everything. With my FT-897D I have found that AM sounds much better with far less distortion if I use a microphone with a frequency response tailored for the higher end of the spectrum. I recently converted an unamplified Astatic stand for a D-104 and a 10DA mic element from high impedance to 600 ohms using a signal stage impedance buffer with a simple FET circuit. These microphones typically were used on old tube rigs in the old days and sound great on AM. The 10DA sounds much like a Heil element on SSB but both are too high pitched for FM, especially the D-104. The stock microphone is pretty mushy on AM and the bass response causes distortion that sounds like power is being robbed from the carrier.

73,
Steve - AA5TB

Ok Steve

No this more than just a mike miss match , all other modes are working fine ... in the tech description it talks about un balacing the mixer to make AM .. thats working , but something is badley clipping ... ssb is fine so its not the audio ... dosen't look to be any adjustments ..

may try a full power on re set .. see if that changes thing's ?

Tnx - G .

Topic: 29538 Message: 29565

Dear Dr. Khalid AP2DKH
I say same as Om AE8U mentioned here.
Please check your radio with an other computer system and cable too.
First try with an other pc then get CT-62 cable from me. if still not work then go the radio. Your Radio CAT port is not working . this is very simple solution to find out the problem. either you radio port is faulty , cable or pc port. othervise should have a visit to me with all stuff.
have a nice experiment with lot of RFI in shack. hihi..

Good Luck..

AP2GH / Hussain.

29566. Re: Ft 897, Signalink USB, Fldigi on Linux (Debian): Transmitting Issues.

Yahoo group: FT897 (2010)
Date: 2010-03-31 23:00:03 UTC
From: gbongi1
Topic: 29552 Message: 29566

Current configuration:

036 = 0
037 = 30
038 = psk31-U
039 = 0
040 = 50
075 = 100
088

061 = pwr
mfi[b] = mod

Here is a video of what is happening

http://www.youtube.com/watch?v=CX9DZ-ujDvs

I am also using pulseaudio. Maybe I should take a video of that too.

Thanks for your help.

29567. CAT CONTROL VERSUS BEEP TONE

Yahoo group: FT897 (2010)
Date: 2010-04-01 10:15:35 UTC
From: ap2dkh
Topic: 29567 Message: 29567

Dear ALL,
As I mentioned in my previous requests that the 897 does not communicate with the computer.I have got a clue that the beep tone which comes while changing mode,band etc becomes distorted i.e it is not clear as it should be.As long as the beep tone is distorted the FT897 does not communicate with the computer. Some time after reseting the radio the tone becomes clear and at the same time it starts communicating with computer. Some time it does not become clear after many times reseting and even after master reseting.
However if the beep tone is clear the radio communicate with the computer and if distorted then no communication with computer.
Please guide and help me in diagnosing the fault.
Regards Dr.Khalid de AP2DKH

29568. RF Systems Power Isolator

Yahoo group: FT897 (2010)
Date: 2010-04-01 10:45:05 UTC
From: Trixter aka Bret McDanel
Topic: 29568 Message: 29568

I am wondering if anyone has realworld experience with the RF Systems Power Isolator. I can come up with all the conjecture I want, and I am sure that some people would love to help pile that on, but I would really like to request real world actual hands on experience comments.

http://www.rf-systems.nl/power-iso.html

How did it perform?
Was the loss 0.5dB or less as they claim?
Did the noise go down?
Any close calls on lightning? Did the device work as advertised?
Any Tx problems?
Did you test 6m, if so what is the drop off above 50MHz?

Thanks!

Well, I received the part from Vertex Standard, took apart, and replaced the Pot. I'm happy to say it was fairly easy, and the radio is repaired.

Problem is, I was able to continue to use the original knob <grin> (so now I have spares).

Hey Gang,

Just a quick question which I am sure any number of you can answer. I am about to order my first FT897. As I am looking at the list of accessories, I notice there is a programming/software cable, which I understand.

There is also a Computer Interface Cable, which I assume allows you to talk to the computer with the radio. Here's my question...if I get the programming/software cable, do I still need the Interface Cable?

I have a Rigblaster Pro at home which I would like to use with the 897.

Please excuse my ignorance :-)

Jeff, KC2DAQ

hello jeff
if you are using the ct-62 cat cable you can use software to program the rig it uses the clone setting

for soundcard modes you will need the the rigblaster or some other interface but to control the freq etc at the same time you will need a cat cable

rigblaster works fine or mixw etc but there is no freq readout from the rig to the pc and back
http://www.xggcomms.com/page4.htm quite cheap cables

i am using a mfj-1275m soundcard radio interface and a ct-62 cable

The cable, which can be obtained separately or made yourself, is
required to connect the serial port to the CAT/Data port of the radio.

I for example have two cables, one is for the DATA port, which lets me
press the PTT, get audio in/out, etc. I use this for packet. I have
another cable which does serial and wrote a perl library which is freely
available so that others may write their own software (perl is available
for windows, osx, linux, bsd, ... virtually all platforms).

> I have a Rigblaster Pro at home which I would like to use with the
> 897.
>

not familiar with that, if it has a serial (rs232/usb) end for your
computer and a CAT/Data end for the radio it should work providing it
connects in a way the software understands.

When you order the program and cable, you get the DATA cable which fits into the Data port on the back of the FT897. The other cable is for controlling your radio for Ham Radio Deluxe and other programs and plugs into CAT port on the back of the Radio. Would suggest you get the AT-897 tuner from LDG and then the CAT cable plugs into back of tuner.

Any ideas why the radio will not allow cloning. When the MODE buttons are pushed when powering up, the radio does not emit the three tones, indicating it is ready to receive or transmit the data.

That does not physically isolate the radio from the antenna. With the other device there is no current path for lightning to travel through. I did not want to talk about price, which is what this thread seems to have turned into. I wanted to know if anyone had hands on experience with that particular item and if it worked as advertised.

thanks

Hi,

2 things I noticed on your video. The RF power setting is far too high. Psk31 as with all digital modes is a continuous mode and you run the risk of damaging your rig running more than 50% of the maximum output ie don't use more than 50w. Also you need to have your meter set on alc as any alc at all will make your signal wide on the waterfall and potentially bleed over other people.

I use portaudio with no problems. I suggest trying that setting, you just need to select the USB soundcard in your Signalink for capture and playback. Also in soundcard configuration click on the mixer tab and check the manage mixer box. This will give you TX and RX volume controls on the fldigi GUI. When transmitting move the slider up carefully until alc shows on the meter and back it off til it disappears. If no alc then you still have a problem. It will either be with soundcard settings or the audio out is not getting to the correct pin on your 897.

29594. CAT PORT / BEEP TONE HELP NEEDED

Yahoo group: FT897 (2010)
Date: 2010-04-03 00:49:12 UTC
From: ap2dkh
Topic: 29594 Message: 29594

Dear ALL,
As I mentioned in my previous requests that the 897 does not communicate with the computer.I have got a clue and some observations that the beep tone which comes while changing mode,band etc becomes distorted i.e it is not clear as it should be.As long as the beep tone is distorted the FT897 does not communicate with the computer. Some time after reseting the radio the tone becomes clear and at the same time it starts communicating with computer. Some time it does not become clear after many times reseting and even after master reseting.
However if the beep tone is clear the radio communicate with the computer and if distorted then no communication with computer.Further more the voltages at the cat port pin 4 are 5volt which are present all the times, BUT the voltages at pin 5 are 2.5 and these are not present all the times. These are present only when the beep tone is clear and the radio communicate with the computer.I have compared it with another FT897 in which the 5 volt are present all the times at pin 4 and 5 of the cat port.
Please guide and help me in diagnosing the fault.
Regards Dr.Khalid de AP2DKH

I have owned quite a few 857's (electrically the same as an 897) and I just ran into this on a 2008 vintage one. The static comes and goes on this particular one and could be there one day and not the next. Anyway, it sounds like static crashes to the 10th magnitude on every band including 2m and 440. If you check around, it seems to be with 2007 thru 2009 vintage 857's and 897's so I suspect a bad run of a particular part or parts. If they replaced the ceramic filter and it cured it, I would believe it. One guy placed .01mfd caps on his filters and this cured it as well. I guess Murata had a bad run as this is typically the supplier of ceramic filters to Yaesu. Incidently, I have a mechanical filter installed and it happens. My guess is that it is way up the chain and not the ordinary ceramic filter (2.6) since it happens on every band in every mode with mine. It is so bad that it affects the S-meter as well. Then the next minute its gone! Richy N2ZD

29597. S8 when connected to Laptop

Yahoo group: FT897 (2010)
Date: 2010-04-03 07:27:50 UTC
From: skippy_in_space
Topic: 29597 Message: 29597

Have started to play with HRD with the FT897 through my laptop but when connected Background static goes from S0 to S6-8. What can I do to get it back to S0 (Its hard enough to make contacts with 50w)

Equipment -

Radio - FT897
Computer - Rock laptop, plugged into mains, with a wifi connection
Cable - Cat cable into a serial usb connector
Software - HRD
Antenna - MFJ Magloop and auto tuner
Power - 50w

Any suggestions, I am currently looking for a cheap / refurb / second hand laptop / notebook for this opperation but it might be a few months before I get funding, So I'm open to any suggestions for this as well.

Thanks for your help

2M0BVN (Dont know why but when contesting I get M0BVN or 2M0BWN)

Ian

I wonder if the laptop (or its serial adapter) disagrees with the radio as to what voltage earth is at. Does the problem go away when either (preferably the laptop) are on battery?

... Alternatively the DC-DC converted in the serial adapter? The one I have outputs at +-5V, so still has a DC-DC converter to achieve that. If the noise is from there it would be detectable by bringing it close to the radio/antenna while not connected to it.

I thought that the rf power was too high.
2 folks on the boards were saying that the power should be set to 100.
I always thought that was too high and not necessary. Re set to 5 w

>Also you need to have your meter set on alc as

Under fldigi configuration:
configure > soundcard.

"devices" tab with "PortAudio" radio button clicked.
"capture" = USB audio Codec: USB Audio (hw:2,0)
"playback" = USB audio Codec: USB Audio (hw:2,0)

> Also in soundcard configuration click on the mixer tab and
> check the manage mixer box. This will give you TX and RX volume controls

"mixer" tab has "OSS mixer"
"manage" bu not tx or rx volume

This video might be hard to see because of compression.
http://www.youtube.com/watch?v=zAJFBJJiBvg

I don;t see the tx/rx volume controls

> on the fldigi GUI. When transmitting move the slider up carefully until

I am not sure I have the same sliders?

> you still have a problem. It will either be with soundcard settings

The sound card setting in Linux right?

> the audio out is not getting to the correct pin on your 897.

I have a tigertronics 6 pin dim along with the new pin module made for my radio.

I ordered those thinking that I may have made a bad cable or my pin jumpers are wrong.

I will keep plugging away at it. I appreciate any help you can provide.

29611. "tune" function (not part of a tuner) and 897D marking Qs

Yahoo group: FT897 (2010)
Date: 2010-04-05 19:46:13 UTC
From: ke0ms
Topic: 29611 Message: 29611

All,

I have two questions. These may be simple to you all, but to me i'm still not able to find the answer.

Is there manual "tune" button like we are used to with older rigs? Not tied to an antenna tuner, I mean. If I am going to use a manual antenna tuner (or tweak the setting of an outboard auto tuner), it seems to me that a manual TUNE function needs to exist. Currently I have to just hit multiple dashes on my paddle (which is poor practice and seems ridiculous on such a nice radio)... Strangely, I seem to find there is a display button function called "TUNE" tied to a soft key under the meter when I go thru the menus, but pushing "TUNE" gets me NOTHING.

A different question: Based on purchase date (new) of November 2009, I bought an 897D from a dealer *allegedly*, but when I look on the side of the radio, it only says FT-897. Did they not mark the actual 897D units differently by adding the "D" to the model number on the sticker? I dont have the radio here to post the serial number for analysis that way.

Thank you all.
Wayne, ke0ms

Wayne,

I can answer only the second part of your question, no, Yaesu didn't label them with the "D", but if your rig can get 60 metres, then you have the newer version.
We got our rig around the same time as you, end of October I think, and it's an 897D.

Cheers!

29613. RE: [FT897] "tune" function (not part of a tuner) and 897D marking Qs

Yahoo group: FT897 (2010)
Date: 2010-04-05 20:00:44 UTC
From: Dennis
Topic: 29611 Message: 29613

If I understand you, you are looking for something to send a carrier in order to adjust settings with a tuner without having to manually press a ptt or tap the cw key. Am I correct? If so, there is no "tune" function for what I believe you are asking. The "tune" button you saw is to select either the tuner (or turn it on/off) or linear option on the cable (I think - without having the book in front of me). It would be nice to have a "tune" function for what you are asking, I agree.

And, No, they didn't put the "D" even on the newer production rigs. However, I am with you that they should have. Only way to figure what production you have is to decipher the serial number. That was posted here not too long ago.

Hope this helps.

Dennis - N8BMB

Subject: [FT897] "tune" function (not part of a tuner) and 897D marking Qs

All,

I have two questions. These may be simple to you all, but to me i'm still not able to find the answer.

Is there manual "tune" button like we are used to with older rigs? Not tied to an antenna tuner, I mean. If I am going to use a manual antenna tuner (or tweak the setting of an outboard auto tuner), it seems to me that a manual TUNE function needs to exist. Currently I have to just hit multiple dashes on my paddle (which is poor practice and seems ridiculous on such a nice radio)... Strangely, I seem to find there is a display button function called "TUNE" tied to a soft key under the meter when I go thru the menus, but pushing "TUNE" gets me NOTHING.

A different question: Based on purchase date (new) of November 2009, I bought an 897D from a dealer *allegedly*, but when I look on the side of the radio, it only says FT-897. Did they not mark the actual 897D units differently by adding the "D" to the model number on the sticker? I dont have the radio here to post the serial number for analysis that way.

Thank you all.
Wayne, ke0ms

To answer your first question:

The "ACC" 1/8in jack on the back will (with a home-built cable plugged in) signal the radio to emit a carrier (some brands of semi-automatic tuners (eg, LDG) use a cable from the tuner to this jack to accomplish this). See page 18 of the FT-897D manual for details.

In case anyone has not tried this yet - here's an example of a weather sat capture using my FT897nd.

http://g0cer.blogspot.com/2010/04/weather-sat-images-first-reasonable.html

(watch the wrap)

I've been using wx2img software which works great on Linux and Windows.

I made a pair of crossed dipoles for inside the loft - but can't get up there to fit them yet, so used my vertical colinear which is meant for 50/144/432MHz and I also found out an old Microwave Modules 2 meter pre-amp - as it was all I had yet - it gave some gain on 137 (anything is better than nothing!).

The registered version WX2Img will control your 897 (it's one of the many selectable choices). I'm not sure about un-reg version - I never thought of trying it then. So to going, get wx2img to update the Keplers off the net and set it to auto record and leave it to get on with it. I pre-tuned the radio to 137.5 and when it kicked off auto-record the radio jumped above 137.5 and gradually fell at the sat passed.

I've played through this Easter break and gradually improving things and the above was the picture I'm most pleased with. I've not tried the control with the Linux version yet - I'm just pleased to be getting better images so far. I'm stuffed for 137.62 as the pager network infects this area at S9.

WX2Img is at http://www.wxtoimg.com/ and the un-reg one functions - the reg on has improvements for narrow bandwidth receivers and lots otherstuff.

I thought I'd report here on what I've done and hope this is of interest.. Good luck to anyone else who tries it too.

There's no tune button that I know of.

What I usually do to tune (when I don't have a CW key present) is to set the radio to AM and hold the Push To Talk button. That sends out a carrier which can be used for tuning. Just make sure that you're at low power because (a) AM is continuous duty and you don't want to blow the finals, and (b) you want to minimize your RF pollution on the band.

There is a setting so that one of the buttons on the microphone can be used in place of a key on CW. I haven't tried that but it should give you the same effect if you set the radio to CW.

Congrats. When I got my 897D I was completely overwhelmed. My other HF rigs were tube rigs, no DSP, data, or menus. I feel like I have finally settled into this radio, and I am happier today with the rig that I was the day I brought it home. I actually enjoyed the process of figuring out the menus and settings. I love this rig!

One thing that helped was to go through and hide all of the menu settings that I did not need to adjust. That way when I scrolled through the menus, I could focus on just the menus that I needed to figure out. DSP was the most difficult for me because I had never used it and I didn't understand what each setting was doing. I still don't have a thorough grasp of what it's doing, but the current settings have it sounding good.

Hi KG6UGS,

I have menu 22 set to 'off', because I don't want to transmit cw when I'm in SSB mode.

Menu 25 on normal and 26 to elect key is correct to use a keyer.

I'm assuming that your problem is that nothing happens when you use your electronic keyer.

Is the mode set to CW?

What is multi function row 'j', key B set to? This key turns keying on and off for full break in.

What do you have menu 24 set to? Are you using full break in? This is how I operate.

73's,

Ron, AD0DX

Hank,

Thank you for still using the old tube rigs. They will both talk circles around these new digital rigs like the 897 and the receive is better also. Oh all these bells and whistles are pretty, but these new rigs are PLUG-PLAY and if it breaks down throw it away. In other words you can't work on these rigs like you can the older rigs. You have to send it back to the manufacturer and IF they still support it, you will get a $200 or $300 bill from them to repair it, on top of the $800 or $900 you paid for the radio. I guess that these new digital boys that were pretty well GIVEN their ham ticket since they dummied the requirements down to get a license like all this DSP crap and digital modes do these best they can and have to have these rigs that they can marry to a computer to be able to get on the air. I guess it is all about the almighty dollar and the manufacturers have taken full advantage of it in their conspiracy with the ARRL. They couldn't make any money if the average ham could repair his own rig and then again, you would be really hard pressed to actually find any of these new hams that actually COULD fix any of the older radio's. They could actually save some money by just leaving off the CW mode on these newer rigs, because these new hams couldn't send an SOS on CW on a sinking ship to save their lives!! Isn't it amazing that us older hams actually got on the air with the old tubes rigs at all?? !!! We did OK, and not only survived with them, but thrived with them. You get on HF now with an old analog HF tube rig and are off 10 HZ and these new digital boys are gonna let you know it. IMMEDIATELY. About 10 of them will jump in there are tell you that you are off frequency!! In the old days we would simply reach down and turn the clarifier and not say a word and go on with the conversation. These new ones will look at you today and ask?? Whats a clarifier?? Amazing. When the only requirement to get a license now days is to memorize a few simple questions and answers and sign your name to the answer booklet to get a license I guess they had to come out with radio's like the 897, 1000 and 2000 with all those menus so the built in digital programs can tune the radio for them. For years I gave the CB'ers hell, but you know I actually owe them a big apology. They BEHAVE 100 X better than most of these new hams on HF. Just listen on ANY given night on 80 meters on say 3810 or 3843. Again, when they dummy down the requirements for a license just to attract people to the hobby in order to sell radio's, thats the kind of operators you get. In our own call area, the 4 call area, they are on the KJ4 xxx already and are down to about the KJ$t (XX) already in the course of about 4 months. Go to QRZ or any call sign database and just plug any 3 letters in after the KJ4 and you will be very very very lucky to come up with a license class where they actually have a General or above. 95 % of them are Techs and got into it to chase storms or babysit the kids that have a license too. Oh well enough of my rants and raves. There is nothing I can do about it.
Keep those old tube rigs around Hank. They will be working and on the air when most of these newer digital rigs are in the trash heap.

Me? I wasn't saying anything bad about the 897, I love my 897D. I was only saying that having just used tube rigs before, it took me a while to figure out how to use DSP. My first rig was a Kenwood TS-520SE, a solid state with tube finals. My second rig I got from my grandfather W4GHA when he went SK; it was a Drake TR-4C. Regardless of any future HF rig purchases, I don't think I'll ever get rid of my 897D.

The only other thing that really stumped me with the 897D was the MD-100A8X desk mic. The first month or so I was getting rave reports on VHF/UHF, but horrible reports on HF. I was condisering going back to the included hand mic because I cannot afford a heil right at the moment. So just for grins, I was looking at the included manual (piece of paper) that came with the MD-100 and I saw a comment about using this mic with the 897 that I obviously missed when first "glancing" at the paper. It said when using the mic with the 897 and a few other models, select "bypass" on the bottom of the mic. I was using the built-in mic filters. As soon as I switched it to bypass, I jumped on the Intercon Net on 20 meters and got a great report. Since then, I have gotten quite a few positive comments about my audio quality.

I am a big Yaesu fan, but I'm a bigger fan of the 897D.

My 897 and I were getting good reports on VHF/UHF and bad on hf. I use the standard mike. I adjusted the ssb hf mic gain down quite a bit, to just where you could see the bar moving with meter set to alc on transmit. Fm mic gain has a setting also which I did not adjust. I get good reports now on both hf and VHF/UHF.

Hi Larry,

I have found that selecting postion #2 on the back of the microphone helps a lot on SSB. It seems that the #1 position leaves too much power robbing bass response.

The real problem on HF may be your antenna. The Buddipole is not too bad on 20 m and higher frequencies but on the lower bands the efficiency really falls off, especially at the low heights most people use it at. More details about your antenna setup such as heights and frequency might be useful. Also, using an antenna tuner on a high-Q antenna like the Buddipole can be a poor combination. The antenna itself should be adjusted to work properly at the operating frequency instead of depending on a tuner at the rig. The tuner is okay to use to improve the match only after the antenna is adjusted. Without going into great detail here I'll just say that this is less of an issue with much larger antennas.

Also, because of the high sensitivity of the receiver you can usually hear well even with a very poor antenna because the external atmospheric noise is usually the limiting factor in signal to noise ratios. Hearing far away stations doesn't really give you an idea of antenna performance.

I hope this gives you some ideas to solve your problem.

73,
Steve - AA5TB

Larry-
Look at the back side of the mike- The "TONE" should be set to "2". Maybe that will help-

Here are my settings for HF SSB:

Menu #48 - DSP Mic EQ: Both.
Menu #74 - Proc Level: 30
Menu #81 - SSB Mic Gain: 85

I believe my Mic Gain (Menu 81) was lower when using the handheld mic, I think 50 if my memory serves me correctly. I also had the switch on the back set to position 2.

The best thing to do is set up the mic per peoples recommendation and then tweak them with the help of someone while in a QSO. Our recommendations will get you close, but everyone's voice is different, so having someone help you with On-Air feedback will help you get it dialed in perfect for your voice.

hth,

Hank / KB4MTO

Your right Robert, when they did away with spark gap transmitters they ruined HAM Radio. I remember the old 2 meter radios that took two people to pick up and you had to run the motor in the car to operate the radio, now you can operate all day with the motor off and your 5 year old grand kid can carry the radio, it is pure waste. With the right Elmer, for every Tech there is a General or Extra waiting to come out. You'll feel better about new Techs if you will take a couple under your wing and introduce them to the fun of Ham radio. I made Extra because somebody cared not just that I had a license but that I learn that there was more to Ham radio than a Tech license.

Subject: [FT897] Re: New 897

Hank,

Thank you for still using the old tube rigs. They will both talk circles around these new digital rigs like the 897 and the receive is better also. Oh all these bells and whistles are pretty, but these new rigs are PLUG-PLAY and if it breaks down throw it away. In other words you can't work on these rigs like you can the older rigs. You have to send it back to the manufacturer and IF they still support it, you will get a $200 or $300 bill from them to repair it, on top of the $800 or $900 you paid for the radio. I guess that these new digital boys that were pretty well GIVEN their ham ticket since they dummied the requirements down to get a license like all this DSP crap and digital modes do these best they can and have to have these rigs that they can marry to a computer to be able to get on the air. I guess it is all about the almighty dollar and the manufacturers have taken full advantage of it in their conspiracy with the ARRL. They couldn't make any money if the average ham could repair his own rig and then again, you would be really hard pressed to actually find any of these new hams that actually COULD fix any of the older radio's. They could actually save some money by just leaving off the CW mode on these newer rigs, because these new hams couldn't send an SOS on CW on a sinking ship to save their lives!! Isn't it amazing that us older hams actually got on the air with the old tubes rigs at all?? !!! We did OK, and not only survived with them, but thrived with them. You get on HF now with an old analog HF tube rig and are off 10 HZ and these new digital boys are gonna let you know it. IMMEDIATELY. About 10 of them will jump in there are tell you that you are off frequency!! In the old days we would simply reach down and turn the clarifier and not say a word and go on with the conversation. These new ones will look at you today and ask?? Whats a clarifier?? Amazing. When the only requirement to get a license now days is to memorize a few simple questions and answers and sign your name to the ans! wer book let to get a license I guess they had to come out with radio's like the 897, 1000 and 2000 with all those menus so the built in digital programs can tune the radio for them. For years I gave the CB'ers hell, but you know I actually owe them a big apology. They BEHAVE 100 X better than most of these new hams on HF. Just listen on ANY given night on 80 meters on say 3810 or 3843. Again, when they dummy down the requirements for a license just to attract people to the hobby in order to sell radio's, thats the kind of operators you get. In our own call area, the 4 call area, they are on the KJ4 xxx already and are down to about the KJ$t (XX)

already in the course of about 4 months. Go to QRZ or any call sign database and just plug any 3 letters in after the KJ4 and you will be very very very lucky to come up with a license class where they actually have a General or above. 95 % of them are Techs and got into it to chase storms or babysit the kids that have a license too. Oh well enough of my rants and raves. There is nothing I can do about it.
Keep those old tube rigs around Hank. They will be working and on the air when most of these newer digital rigs are in the trash heap.

Stew,

I agree with you that if a few of the oldtimers would spend more time helping people get interested in Amatuer Radio instead of putting us fairly new guys down, the hobby would be a heck of a lot better. I am privileged to have some good Elmers in the local area that finally helped me to decide to get off the fence and get my license. I am now a General and am studying for my Extra thanks to them. If we had people like Robert that always complain about how Amatuer Radio is dummed down, I never would have gotten into this great hobby.

Now back on subject, I love my FT-897D. It was my first radio and I am still learning about it thanks to this group.

Danny
KE5WDI

P.S. I thought we were suppose to sign off with our name and call sign on this group. Wonder why Robert didn't.

Danny,

When they pass a real test for ham radio, I'll be happy to help them. I'll help them now go back down to vhf and 11 meters where they belong.

If I passed a test to be licensed as a physician, and was given the Exact questions and exact answers beforehand and could take the test as many times as I wanted to until I passed it and when I finally did, the government issued me a license to practice medicine, would you consider me a real doctor and come to me for your medical needs??

C'mon guys, we (my wife and I) became hams recently (Oct 09) , technicians for a month before going for our generals, but the tests are nothing.
You really start learning hands on when you get your first rig, an 897 in our case, and when you climb on the roof to install your first antenna, and when you actually get on the air and start dxing...and you never stop learning, learn something new every day it seems...
True, the tests did not prepare us for what was before us, but we're now doing voice as well as digital on both VHF and HF and enjoying every minute of it.

Let's enjoy the hobby while we can!

Cheers!

From: Matt Patterson
Topic: 29620 Message: 29643

That□s about the craziest analogy I□ve ever heard. Ham Radio is a hobby not a profession such as practicing medicine. Since the tests are now obviously easier than they once were it now falls upon us folks who have been in the hobby a while to embrace the newly licensed hams and tech them ourselves. Not shun them for taking the time to get their license. After all, it□s not their fault that the FCC changed the tests and dropped CW. If I had met such harsh resistance as yours when I first was licensed I probably would have hung it up along time ago.

BTW: VHF and up is where it□s at BABY! I get a lot more satisfaction when I work a new grid on 2m and above than I ever have working DX on HF.

Danny,

When they pass a real test for ham radio, I'll be happy to help them. I'll help them now go back down to vhf and 11 meters where they belong.

If I passed a test to be licensed as a physician, and was given the Exact questions and exact answers beforehand and could take the test as many times as I wanted to until I passed it and when I finally did, the government issued me a license to practice medicine, would you consider me a real doctor and come to me for your medical needs??

> Thank you for still using the old tube rigs. They will both talk circles around these new digital rigs like the 897 and the receive is better also. Oh all these bells and whistles are pretty, but these new rigs are PLUG-PLAY and if it breaks down throw it away. In other words you can't work on these rigs like you can the older rigs. You have to send it back to the manufacturer and IF they still support it, you will get a $200 or $300 bill from them to repair it, on top of the $800 or $900 you paid for the radio. I guess that these new digital boys that were pretty well GIVEN their ham ticket since they dummied the requirements down to get a license like all this DSP crap and digital modes do these best they can and have to have these rigs that they can marry to a computer to be able to get on the air. I guess it is all about the almighty dollar and the manufacturers have taken full advantage of it in their conspiracy with the ARRL. They couldn't make any

> money if the average ham could repair his own rig and then again, you would be really hard pressed to actually find any of these new hams that actually COULD fix any of the older radio's. They could actually save some money by just leaving off the CW mode on these newer rigs, because these new hams couldn't send an SOS on CW on a sinking ship to save their lives!! Isn't it amazing that us older hams actually got on the air with the old tubes rigs at all?? !!! We did OK, and not only survived with them, but thrived with them. You get on HF now with an old analog HF tube rig and are off 10 HZ and these new digital boys are gonna let you know it. IMMEDIATELY. About 10 of them will jump in there are tell you that you are off frequency!! In the old days we would simply reach down and turn the clarifier and not say a word and go on with the conversation. These new ones will look at you today and ask?? Whats a clarifier?? Amazing. When the only requirement to
> get a license now days is to memorize a few simple questions and answers and sign your name to the ans! wer book let to get a license I guess they had to come out with radio's like the 897, 1000 and 2000 with all those menus so the built in digital programs can tune the radio for them. For years I gave the CB'ers hell, but you know I actually owe them a big apology. They BEHAVE 100 X better than most of these new hams on HF. Just listen on ANY given night on 80 meters on say 3810 or 3843. Again, when they dummy down the requirements for a license just to attract people to the hobby in order to sell radio's, thats the kind of operators you get. In our own call area, the 4 call area, they are on the KJ4 xxx already and are down to about the KJ$t (XX) already in the course of about 4 months. Then I'd have to ask, 'Why are you even on here?' I mean, if you're only content to talk to folks that already know it all... What's the point of your posting anything?

Just asking, 'cause I still want to learn.

29645. New vs. Old: The key is learning [was: New 897]

Yahoo group: FT897 (2010)
Date: 2010-04-09 02:49:21 UTC
From: Dean Gibson AE7Q
Topic: 29620 Message: 29645

What bugs both the old-timers about the new-timers, and vice versa, is the same thing:

Some of us don't want to learn anything new.

The old-timers grouse at how many new-timers don't seem to want to learn anything new (and it's partly true).

The new-timers retort that the old-timers are still stuck in old modes, claiming that they are unable/unwilling to learn/try something new (and it's partly true as well).

Whether you are new or old to amateur (please get the spelling right) radio, you will do well if you decide to continue learning. If you decide you've learned enough (regardless of age), you won't do well.

Amateur radio is changing. Once the only way to communicate cheaply with those in distant places, now the Internet, cell phones, and free long-distance has changed all that (and for the better for most people). As a result, most people interested in communications but not in the technical aspects, don't join amateur radio. As a natural result of amateur radio interests becoming more focused, the ranks of amateur radio are declining. That's a fact of life (and human nature).

Some amateurs are bemoaning the decline of amateur radio operators, and are getting anyone they can find to get a license (I see this particularly in the RACES ranks). Most of these people treat the radio just like most people treat the telephone: as an incomprehensible appliance. In one sense there's nothing wrong with that; amateur radio has a lot of different interest groups. But in another sense, there's a problem with that:

Every amateur is licensed to modify his/her radio, no matter what the ignorance level. We see amateurs modifying the service-level calibration settings (and of course not saving the values before they change them), because they're not hearing the traffic on the bands that they think they should. We see amateurs complaining that they bought a watt-meter, and it only shows 80 or 90 watts out rather than 100, and should they send the radio back. Of course, the classic (and probably the most common complaint) is that the finals must be blown, since keying the radio in SSB mode shows no power out. I personally cannot understand how ANYONE really tried to LEARN ANYTHING about communications modes, to ask that last question.

So again, it comes down to learning. I think most amateurs (even old-timers) will help others, if the person requesting help has shown an effort to learn something. It amazes me how many amateurs have not read

(or even own) the ARRL handbook (which I devoured cover-to-cover when I was learning amateur radio). The ARRL handbook has kept up with the times, and there is plenty in it for both old and new to learn.

And for the old-timers, if you think CW will get through when all else fails, you're forgetting something: someone at the other end needs to be able to decipher code. Whether we like it or not, CW as a regular communications medium is going away, FOREVER, and there is NOTHING that we can do about it (I supported keeping the CW licensing requirement, but for other reasons). If you think that tube radios are the answer, you are in dream land (and I'm old enough to have owned several tube radio sets, and I still remember what the numbers in the tube designations meant). Power, size, weight, heat, portability, and high voltages have destined them for the "dustbin of history" for virtually all amateur radio usage. Note that the high voltages in tube sets enforced a certain level of knowledge about electricity (with a somewhat steep learning curve for those that didn't), and the lack of affordable pre-built radios meant that most amateurs had to learn a lot to get on the air. Today, it's different; you have to learn how to interpret an often indecipherable translated (and often poorly organized as well) radio manual.

So, if you try to (continue to) learn something about electronics, you will do well. There's a natural inclination to ask a quick question on the Internet, but with that temptation comes the ability to come off as lazy. Do a little research first. I also see here (and more on the Yahoo! Icom IC-7000 forum) an appalling lack of even a BASIC diagnostic capability. Granted, that comes with experience, but there often seems to be no concept of how to reduce or eliminate the variables (one at a time) in order to resolve a problem. I blame that on the USA educational system, but if you don't have the ability to diagnose a problem (by eliminating variables), you are going to have a tough road ahead in amateur radio (even if you never need to open up a handy-talkie).

Finally, all this learning and diagnostic experience comes in handy in other areas. To take a trivial example, I recently decided to add X-10 home automation controls to my TV viewing area so I could adjust the lights while seated (see, there's a bit of laziness in all of us!). However, about 15 years ago I converted my home to 100% CFLs (compact fluorescent lights), and when the kitchen lights were on (six CFLs running), the X-10 controls didn't work very well. While most people would just call X-10 customer service, all they would do is recommend an X-10 RFI filter ($13), and with no guarantee that it would solve the problem. Knowing something about RFI, and using the process of elimination, I found that the X-10 stuff worked OK if I only had three or fewer of the kitchen CFLs screwed in. While I could have bought the X-10 RFI filter, finding a physical place to put it (2"x1.75"x3.5") in the wall presented a bit of a problem. I browsed the Internet, and found that someone had designed up a dual resonant trap T-circuit to put inline with the fluorescent lights. That seemed like unnecessary overkill to me: I mean, what's wrong with just a low-pass filter? The

frequency difference between 60Hz power and the 120kHz X-10 signals seemed wide enough for a simple choke. So, I took a small 1" powdered-iron toroid core laying around, and wound seven turns through it, and placed it inline between the kitchen light switch and the fluorescent lights. Viola! Now I could run FOUR kitchen CFLs without a problem, and I knew that I was on the right track. End result: 21 turns through the toroid, and the problem is solved (for the six CFLs), and the toroid mounts in the space inside the existing switchbox!

OK, but now the switchbox has a slight "hum" when the kitchen lights are on. Why? This is left as an exercise for the reader (I know the answer, and if you do too, don't reveal it).

> I have owned quite a few 857's (electrically the same as an 897) and I just ran into this on a 2008 vintage one. The static comes and goes on this particular one and could be there one day and not the next. Anyway, it sounds like static crashes to the 10th magnitude on every band including 2m and 440. If you check around, it seems to be with 2007 thru 2009 vintage 857's and 897's so I suspect a bad run of a particular part or parts. If they replaced the ceramic filter and it cured it, I would believe it. One guy placed .01mfd caps on his filters and this cured it as well. I guess Murata had a bad run as this is typically the supplier of ceramic filters to Yaesu. Incidently, I have a mechanical filter installed and it happens. My guess is that it is way up the chain and not the ordinary ceramic filter (2.6) since it happens on every band in every mode with mine. It is so bad that it affects the S-meter as well. Then the next minute its gone! Richy N2ZD
>

I have the exact same problem only started yesterday! All bands all modes would appreciate any help. many thanks

29647. Self Audio check

Yahoo group: FT897 (2010)

From: Sean
Topic: 29647 Message: 29647

How do you all check your own mic audio? I would like to try different mics to see which one sounds the best, but don't know how to go about it. Do I need another piece of equipment? Another radio? I tried using the headphones but that didn't seem to work. Thanks!

Here's some info. On the 897D, you must do the solder mod. Also, your local Ham club should be able to help you out as well.

29649. 897 Not able to turn ATAS-120 on

Yahoo group: FT897 (2010)
Date: 2010-04-05 12:09:21 UTC
From: Bernie
Topic: 29649 Message: 29649

Hi, I am new to the group. I have an FT-897D that I am trying to set up with an ATAS-120 antenna. Following the instructions on page 41 of the manual, I turn on and select ATAS(HF&50) as perscribed. I then try to go to Automatic Tuning and follow instructions but when I press the [A] (Tune) as instructed, nothing happens, the "Parentheses" does not appear as they should. Somewhere I am not doing something right but I cannot figure out what it is. Has anyone had this problem and what did you do to get it to work.

Bernie

29650. FM S-METER TOO LOW

Yahoo group: FT897 (2010)
Date: 2010-04-05 19:27:21 UTC
From: pavanroberto
Topic: 29650 Message: 29650

Hy all,

just having funny issue with s-meter RX indication during normal 2 meter FM operations, on my 1 year old FT897D.

Now Max readout is S4 with strong (proven) signals (S9 and more).

I doubled checked all parameters, and reset them to factory default.

NB SQL/RF knob is set to SQL.

What am I missing? is there any HW mulfunction or SW failure?

From: Michael Hughey
Topic: 29611 Message: 29651

The TUNE button is a soft key on the 'A' button after you access the menu by momentarily pressing the menu button. Cycle through the different function sets until TUNE appears over the "A" soft key. The tune button controls the ATAS 120 'Screwdriver' antenna or the automatic tuner to lock in a frequently used freq. When the displays 'atas' becomes 'ATAS' indicating a tuneable freq. You have to already have gone into the main menu by pressing and holding the menu button and cycling to the tuner section and turn the main freq dial to select which setup you want. If you don't have either of those tuners then you manually tune whatever tuner you have in the usual way.

Subject: [FT897] Re: "tune" function (not part of a tuner) and 897D marking Qs

There's no tune button that I know of.

What I usually do to tune (when I don't have a CW key present) is to set the radio to AM and hold the Push To Talk button. That sends out a carrier which can be used for tuning. Just make sure that you're at low power because (a) AM is continuous duty and you don't want to blow the finals, and (b) you want to minimize your RF pollution on the band.

There is a setting so that one of the buttons on the microphone can be used in place of a key on CW. I haven't tried that but it should give you the same effect if you set the radio to CW.

If I am going to use a manual antenna tuner (or tweak the setting of an outboard auto tuner), it seems to me that a manual TUNE function needs to exist. Currently I have to just hit multiple dashes on my paddle (which is poor practice and seems ridiculous on such a nice radio)... Strangely, I seem to find there is a display button function called "TUNE" tied to a soft key under the meter when I go thru the menus, but pushing "TUNE" gets me NOTHING.

29652. FT-897 to LDG AT-100 Pro Tuner ...

Yahoo group: FT897 (2010)
Date: 2010-04-08 15:24:27 UTC
From: Alan E. Lutz
Topic: 29652 Message: 29652

Folks,

I am new to the group and have a question.

For whatever reason, LDG in their infinite wisdom only includes a cable to connect the AT-100 Pro II tuner to an Icom radio. I have a Yaesu FT-897. I see that K4SCH posted photos of the connection to the LDG AT-897 tuner. Does anyone know if the pinouts are the same for the 897 and 100 tuners? . Each end of the 100 cable has a 1/8" stereo phone plugs as shown in K4SCH's photo. I do have reason to believe it is not straight through and is likely as shown for K4SCH's 897 tun er cable. Thanks in advance for the help.

From: JohnB123
Topic: 14573 Message: 29653

Hi all. I am newly licensed and new to the group. I just got a new FT 897d and am awaiting delivery of my antenna. Forgive what might be a silly question, but due to my living conditions, I'll be forced to run more or less portable for at least the near future. Would it be advisable to leave a coax jumper attached to the receiver to avoid "over using" the antenna connection from frequent set up and tear down? I don't know if over use is detrimental to the PL 259 connection.Thanks and 73's,
John KC2WRG

Topic: 29620 Message: 29654

Thanks everyone for this info. I got my 897D a few months ago as my first HF rig, and not being real familiar with HF operation (maybe confirming wa4zvg opinion!), I was wondering if there are some other tips for general settings with the multitude of menus that someone would be willing to pass along?

I have a strong desire to operate appropriately, and want to understand the theory more. So far no one has complained, but if I can be proactive on my side gtting the settings correct it would be a benefit. Any help would be greatly appreciated.

Subject: [FT897] Re: New 897

Here are my settings for HF SSB:

Menu #48 - DSP Mic EQ: Both.
Menu #74 - Proc Level: 30
Menu #81 - SSB Mic Gain: 85

I believe my Mic Gain (Menu 81) was lower when using the handheld mic, I think 50 if my memory serves me correctly. I also had the switch on the back set to position 2.

The best thing to do is set up the mic per peoples recommendation and then tweak them with the help of someone while in a QSO. Our recommendations will get you close, but everyone's voice is different, so having someone help you with On-Air feedback will help you get it dialed in perfect for your voice.

hth,

Hank / KB4MTO

Come on Robert, down in Alabama. Stay calm! I was licensed 2 days after the WW2. Those days if you didn't have money, which no one did, you built everything, receiver and transmitter from scratch and odd parts. You probably never saw the test we had to take to get the Advanced Class License. Pencil and paper, drawing diagrams, etc. etc. Your mom was changing your diapers in 1962 while we were heating our house with the latest home built transmitter. Times and technology change. Live with it. I didn't complain about your generation of "New Hams" that didn't know anything, so let our new brothers prove themselves just as you & I had to. Roger, K8CIX

Hi John,

I think it is a good idea for a couple of reassons. First, as you note, it saves lots of connector wear. Second, you can usually cable tie the pigtail coax to some secure place on/near the radio to avoid accidental strain on the radio connector.

It's a simple, cheap and convenient way to connect the radio.

Dean,

You sure couldn't prove your statement below by listening to the CW activity on bands. I've been licensed 32 years and there is much more CW activity on 40 m then there was. Tune around any evening and there is much more CW activity on 40 m then phone operation. I'll let others guess to why that is. I'm an avid CW operator and all I can tell you is that there is no lack of CW activity. There are a lot of new hams taking interest in it believe it or not.

Your statement may be true in the commercial world.

From: Eric van de Weyer
Topic: 29647 Message: 29660

Hi Sean,

I generally use a set of headphones and another receiver. Often I am checking a mic with a multi band set (such as the FT857 I installed last weekend in the car) and I use a handheld on 2M to listen to the signal to see how it sounds. Very useful in finding problems such as alternator whine (which I had a major problem with in the new installation) and to get an idea of the audio quality from the mic (I am using a boom mic with a PTT on the gear stick).

BTW, it's is nice to sign your messages with a name and callsign.

73....Eric VK2VE.

Matt, I couldn't have said it better myself. When I read the post I wanted to comment, but withheld because my thoughts were less than professional. But I fully agree with what you wrote. My Grandfather was licensed in the WW2 era and built his first transmitter. He was a Electrical Engineer and Signal Corp during the war. He has told me about the tests they took back then, and all I can say is that anyone who could pass one of those test should be proud. But he never turned away helping any ham that needed help, regardless of what test they took.

And what's wrong with VHF? While I prefer HF (17 meters), I have started monitoring 146.520 SSB. Some days I can barely hear someone out there. I cannot wait for my first tropo 2 mtr DX contact.

I'm freshly retired and recently bought a Belcher paddle. I plan to improve my CW speed and be part of that group as well, but that doesn't alter the fact that /"CW as a regular communications medium is going away, FOREVER"/. It's essentially gone NOW in the commercial, government, and military fields; the increased cost of more sophisticated communications equipment is offset by the cost of not having to train and maintain human proficiency. CW lives on only in the hobbyist field. It's interesting and fun from a historical and simplicity perspective, and it will be interesting to see which dies first: CW or AM.

AM lives on for similar historical and simplicity reasons, but that's changing, too: While people listen to AM in their cars (and perhaps on portables), do you know of anyone who listens to AM *at home*? I don't. AM will probably survive for decades for world-wide political and economic reasons. CW has no such forces, but it will survive regulatorily because it can share bandwidth with other digital modes.

While FM (especially narrow-band FM) as a technology will of course survive, I don't believe the FM broadcast band and wide-band FM will; bandwidth is too precious, and there are other technical and economic alternatives growing at a rapid rate. Look what's happened to analog TV; who would have thought that 20 years ago? Look what's happened to public-service FM being replaced by digital trunk radio systems.

The technology has gotten too bandwidth-efficient for some of the older modes to survive regulatorily.

At any rate, I think the CW subbands will be safe for decades.

From: Darrel
Topic: 29459 Message: 29664

Just to add another data point: the identical problem started for me last weekend, on my FT857D (same board as the 897D) purchased new in April 2008. My intermittent lightning-like crashes are also independent of frequency band, being there on all HF bands as well as on 144 and 430 MHz. Both the RF and AF gain controls affect the strength, so it's not something just in the AF amplifier.

I haven't yet found the exact culprit, but looking at the schematic, in my rig it's seems likely to be something after the switchable IF attenuator (which makes no difference, on or off, to the S9 crashes on the meter) and before or within the switchable 455 kHz IF filters (when I switch in a 500 Hz CW filter, the crashes are still there, but weaker, and you can hear the slight "ringing" of the CW filter on the intermittent crashes. That's a very different sound to the crashes coming through the AM filter.) Looking at the schematic, that may narrow it down to a relatively small number of components, although I've not yet located the specific component.

I'd be interested in experiences from others with this problem. I wonder if will turn out to be the same component that fails in all the 2007 thru 2009 rigs.

What I do is find an empty 2 m of 70 m simplex freq and put it on my handheld, then I turn the antenna ATT on (in my case, menu 3 on my VX-8R) so that I don't burn up the front end on that radio. Then I turn the power down on the FT-897 as low as I can get it, then test away. You should probably use ear phones on the HT to avoid feedback.

Yahoo group: FT897 (2010)
Date: 2010-04-09 14:24:16 UTC
From: Charles Scott
Topic: 29650 Message: 29666

All:

Point one - Never compare the S-Meter readings between an all-mode rig like the FT897 and convetional FM only transcievers. The latter will always tend to read very high.

Point two - If at all possible, it's best to supply the radio a properly calibrated signal level to see if it's correct before assuming there's a problem with the metering.

Point three - When trying to diagnose any issue with a radio, it's important to take an organized step-by-step diagnostic approach to determining what is working, what isn't, and exactly what the problem is. If you don't you'll either fix something that's not broken, or change something that will make it worse in some way.

Having said all that, it's entirely possible that the radio isn't reading right.

Assuming this gets posted, you have a bad filter. It appears to be a common failure. There was a discussion about this several months back but it appears to have been deleted. (the Subject Line included: Static Crash like noise.)

29668. RE: [FT897] 897 Not able to turn ATAS-120 on

Yahoo group: FT897 (2010)
Date: 2010-04-09 14:44:22 UTC
From: Michael Hughey
Topic: 29649 Message: 29668

Make sure that you are on an HF freq that's within the limits of the ATAS - 120. You'll know it by looking at the icon "ATAS" on the display. If the icon reads "atas" (small letters), then the ATAS 120 won't tune. Also, menu 20 (CAT/LIN/TUNer) must be on Tuner. Also, if you haven't done so already, scrape some paint off of the vehicle where the little allen screws dig into the frame or run a ground wire. I hope this helps. My FT - 897D has a mind of it's own sometimes and may jump off Tuner, or off ATAS (HF + 50) One time it even jumped in EMERGENCY mode, which prevented me from getting on any other band. Sometimes the mic will revert back to the stock mic settings (I have the mic with the keypad). It doesn't prevent the mic from PTT, but it acts as if the keypad is not there.) I hope this helps.

Subject: [FT897] 897 Not able to turn ATAS-120 on

Hi, I am new to the group. I have an FT-897D that I am trying to set up with an ATAS-120 antenna. Following the instructions on page 41 of the manual, I turn on and select ATAS(HF&50) as perscribed. I then try to go to Automatic Tuning and follow instructions but when I press the [A] (Tune) as instructed, nothing happens, the "Parentheses" does not appear as they should. Somewhere I am not doing something right but I cannot figure out what it is. Has anyone had this problem and what did you do to get it to work.

Yea....that's a real great attitude. It'll do wonders for the future of amateur radio too. I'm sure glad my elmer had more patience and understanding than you. Get over yourselves.

> > Your right Robert, when they did away with spark gap transmitters they ruined HAM Radio. I remember the old 2 meter radios that took two people to pick up and you had to run the motor in the car to operate the radio, now you can operate all day with the motor off and your 5 year old grand kid can carry the radio, it is pure waste. With the right Elmer, for every Tech there is a General or Extra waiting to come out. You'll feel better about new Techs if you will take a couple under your wing and introduce them to the fun of Ham radio. I made Extra because somebody cared not just that I had a license but that I learn that there was more to Ham radio than a Tech license.

Oh all these bells and whistles are pretty, but these new rigs are PLUG-PLAY and if it breaks down throw it away. In other words you can't work on these rigs like you can the older rigs. You have to send it back to the manufacturer and IF they still support it, you will get a $200 or $300 bill from them to repair it, on top of the $800 or $900 you paid for the radio. I guess that these new digital boys that were pretty well GIVEN their ham ticket since they dummied the requirements down to get a license like all this DSP crap and digital modes do these best they can and have to have these rigs that they can marry to a computer to be able to get on the air. I guess it is all about the almighty dollar and the manufacturers have taken full advantage of it in their conspiracy with the ARRL. They couldn't make any
> > money if the average ham could repair his own rig and then again, you would be really hard pressed to actually find any of these new hams that actually COULD fix any of the older radio's. They could actually save some money by just leaving off the CW mode on these newer rigs, because these new hams couldn't send an SOS on CW on a sinking ship to save their lives!! Isn't it amazing that us older hams actually got on the air with the old tubes rigs at all?? !!! We did OK, and not only survived with them, but thrived with them. You get on HF now with an old analog HF tube rig and are off 10 HZ and these new digital boys are gonna let you know it. IMMEDIATELY. About 10 of them will jump in there are tell you that you are off frequency!! In the old days we would simply reach down and turn the clarifier and not say a word and go on with the conversation. These new ones will look at you today and ask?? Whats a clarifier?? Amazing. When the only requirement to
> > get a license now days is to memorize a few simple questions and answers and sign your name to the ans! wer book let to get a license I guess they had to come out with radio's like the 897, 1000 and 2000 with all those menus so the built in digital programs can tune the radio for them. For years I gave the CB'ers hell, but you know I actually owe them a big apology. They BEHAVE 100 X better than most of these new hams on HF. Just listen on ANY given night on 80 meters on say 3810 or 3843. Again, when they dummy down the requirements for a license just to attract people to the hobby in order to sell radio's, thats the kind of operators you get. In our own call area, the 4 call area, they are on the KJ4 xxx already and are down to about the KJ$t (XX) already in the course of about 4 months. Go to QRZ or any call sign database and just plug any 3 letters in after the KJ4 and you will be

very very very lucky to come up with a license class where they
> > actually have a General or above. 95 % of them are Techs and got into it to chase storms or babysit the kids that have a license too. Oh well enough of my rants and raves. There is nothing I can do about it.

Thanks. I thought I'd seen earlier posting about this, but couldn't find it either.
Do you remember if it was reported as XF1001 or CF1005?
Darrel.

All:

In the beginning, Radio Amateurs were tinkerers and inventors. As the hobby developed, that tradition continued and I would argue is alive and well today. In time, other aspects of Ham Radio evolved that included good will, public service, emergency/disaster communications support, and the simple pleasure and excitement of communications. Anyone who expects all Hams to fit into a classic mold is bound to be disappointed.

There will always be those tinkerers. There will always be the classic modes--yes, including CW. There will always be true engineers in our hobby. There will, however, be members of our ranks who are not interested in those aspects of Ham Radio and who will morph the hobby to be what they envision it to be.

I've been a Ham for 46 years and cut my teeth on tube gear, CW, and AM. I've built equipment, constructed antennas, and engineered repeater systems. I would not, however, expect all others to follow the path I have taken. I appreciate the contribution all Hams make to our hobby, whether that's "appliance operators" having a nice chat with some DX station, training with local emergency services to provide support in a time of need, or developing new digital communications modalities. It is simply not necessary that they do it my way and, frankly, I appreciate that they do bring diversity to the hobby I love.

It's not a technical test, nor prowess in repair, nor the Extra Class moniker that makes a Ham. It is instead a desire and a willingness to become involved, in whatever way, and in doing so to enjoy, improve, and promote Ham Radio.

I do like your way of thinking. I'm a "newbie" Ham(tech 2002, general 2005 and extra 2009)
and am pretty much an "appliance operator" I reckon. I have, however, built almost all my
antennas, except for my 5BTV vertical, which I purchased in the flush of new generalhood.
I'm presently acquiring the bits and pieces neccessary for constructing a 5 band Hexbeam
and am hoping to finish it later in the year. Thank you for your part in making us new Hams
feel more accepted and welcome.

Harold

Just got my 897 back from Yaesu today. They replaced a ceramic filter and that took care of it. They charged $70.

The static comes and goes on this particular one and could be there one day and not the next. Anyway, it sounds like static crashes to the 10th magnitude on every band including 2m and 440. If you check around, it seems to be with 2007 thru 2009 vintage 857's and 897's so I suspect a bad run of a particular part or parts. If they replaced the ceramic filter and it cured it, I would believe it. One guy placed .01mfd caps on his filters and this cured it as well. I guess Murata had a bad run as this is typically the supplier of ceramic filters to Yaesu. Incidently, I have a mechanical filter installed and it happens. My guess is that it is way up the chain and not the ordinary ceramic filter (2.6) since it happens on every band in every mode with mine. It is so bad that it affects the S-meter as well. Then the next minute its gone! Richy N2ZD

I was beginning to think that I had joined the wrong group. I was thinking that it was a support group for owners of the FT-897D. Then, for a few days, there are all these opinions about oldies and newbies and that whole thing turned into an opportunity for people to complain about the hobby. Therefore, Charles, I really appreciate your perspective. I hope that sometime, we can get back to being supportive of 897 owners.

Pete,

Just out of curosity, what was the turn around time on your radio? I had the same problem last year. Shipped on a Monday and had it back the following Monday. Mine was in warranty at the time. From KY to CA and back in 7 days is rather inpressive.

Thanks,

Craig

That's a fine way of saying it, I think. Now that everyone has had his say, maybe this place can return to being a forum about the ft897.

From: Bernie
Topic: 29620 Message: 29678

I am new to this list. I am also a re-newed operator having started out 35 years ago, yes as a novice - taking the test and code too. Then with restraints of work, I had my own restaurants that required anywhere from 16 or more hours a day, I didn't have time to keep at it. Now that I am into forced retirement, massive heart attack, I am back at it and enjoying what I am "learning" all over again. I came into the forum and one of the first things that I saw was someone beratting me and all other "techs" because we have "appliances" to operate. I have a FT-897D that I will be using as a portable and also a FT-2000D that I am setting up as my main station. I thought this was about the FT-897's. His ranting about me and all others that "don't have a 50 year history" as an op just about turned me off to this forum. I wonder if he has an 897 even or maybe he is not able to "use" his knowledge to get it working right.

But as I stayed around I saw people that are true elmers coming on board. This forum is about learning and that is what I am trying to do. Yes I am having trouble getting my 897 working but I am working on it. And it has nothing to do with the knowledge, or lack of, that I have from designing and building my own transmitter many years ago.

I will step down now. This has been burning me since I read it and had to get it off my chest. All I know is I am an amaetuer operator just like he is and well on my way to my next level.

Just listen on ANY given night on 80 meters on say 3810 or 3843. Again, when they dummy down the requirements for a license just to attract people to the hobby in order to sell radio's, thats the kind of operators you get. In our own call area, the 4 call area, they are on the KJ4 xxx already and are down to about the KJ$t (XX) already in the course of about 4 months. Go to QRZ or any call sign database and just plug any 3 letters in after the KJ4 and you will be very very very lucky to come up with a license class where they actually have a General or above. 95 % of them are Techs and got into it to chase storms or babysit the kids that have a license too. Oh well enough of my rants and raves. There is nothing I can do about it.

18 days from Michigan to California and back. Not in warranty, but they kept in touch, gave me an estimate to approve first, and satisfied their customer.

Hello Bernie, glad you stayed. The 897D is my first digital HF rig and I also had trouble figuring it out. I have used HF rigs for years, was a 30454 Ground Radio Comm Specialist in the USAF so I know comm gear, and I'm an IT professional now so I'm not foreign to computers. But todays digital radios have technology in them that is not standard day-to-day info. Keep at it and send your questions to this group; you'll get the answers you need and be enjoying the rig before you know it.

73,

Hank / KB4MTO

Thanks, Pete!

I just like to keep track of these things for what ever reason. Sounds like good service to me.

I suspect production of the 897 will cease not too far into the future. And I hope I can have the funds to get another and stash it away. Dar fine radio for what it does. I use mine mostly on V/UHF and SWLing. Lost interest in HF years ago with the exception of digital modes on 20 and 40.

Then who knows, It's life may be like the FT-840. Still a bargin HF rig.

Have a pleasant weekend!

Craig

Just have fun and enjoy radio. It is just that simple. Geez, some of you guys are worst than toddlers. Don't spend time on things which do not affect the rhythm of your life. Too much time is wasted on appliance vs. vintage operators, dxers vs. casual users, digital vs analog operators, Cbers vs. Hamsters, HF'ers vs. High banders, and AM'ers vs. SSBers. Life is short. Care for someone who's suffering from a major disease which makes them immobile and incoherent for the last 3-months of their life. I think you will find perspective.

Just get on the air and talk. I find the most intelligent are the most humble, the ones who merely know just enough to be dangerous are the most arrogant, judgmental, and the biggest complainers/ want-to-be controllers.

Some of my rules:
1. Age does not necessarily bring forth wisdom.
2. It does not matter how you start, but how you finish.
3. You don't need a license to have honor.
4. Given the chance life is merely survived if you are standing outside the fire-Garth Brooks.

Subject: [FT897] Re: New 897

I am new to this list. I am also a re-newed operator having started out 35 years ago, yes as a novice - taking the test and code too. Then with restraints of work, I had my own restaurants that required anywhere from 16 or more hours a day, I didn't have time to keep at it. Now that I am into forced retirement, massive heart attack, I am back at it and enjoying what I am "learning" all over again. I came into the forum and one of the first things that I saw was someone beratting me and all other "techs" because we have "appliances" to operate. I have a FT-897D that I will be using as a portable and also a FT-2000D that I am setting up as my main station. I thought this was about the FT-897's. His ranting about me and all others that "don't have a 50 year history" as an op just about turned me off to this forum. I wonder if he has an 897 even or maybe he is not able to "use" his knowledge to get it working right.

But as I stayed around I saw people that are true elmers coming on board. This forum is about learning and that is what I am trying to do. Yes I am having trouble getting my 897 working but I am working on it. And it has

nothing to do with the knowledge, or lack of, that I have from designing and building my own transmitter many years ago.

I will step down now. This has been burning me since I read it and had to get it off my chest. All I know is I am an amaetuer operator just like he is and well on my way to my next level.

> Thank you for still using the old tube rigs. They will both talk circles around these new digital rigs like the 897 and the receive is better also. Oh all these bells and whistles are pretty, but these new rigs are PLUG-PLAY and if it breaks down throw it away. In other words you can't work on these rigs like you can the older rigs. You have to send it back to the manufacturer and IF they still support it, you will get a $200 or $300 bill from them to repair it, on top of the $800 or $900 you paid for the radio. I guess that these new digital boys that were pretty well GIVEN their ham ticket since they dummied the requirements down to get a license like all this DSP crap and digital modes do these best they can and have to have these rigs that they can marry to a computer to be able to get on the air. I guess it is all about the almighty dollar and the manufacturers have taken full advantage of it in their conspiracy with the ARRL. They couldn't make any money if the average ham could repair his own rig and then again, you would be really hard pressed to actually find any of these new hams that actually COULD fix any of the older radio's. They could actually save some money by just leaving off the CW mode on these newer rigs, because these new hams couldn't send an SOS on CW on a sinking ship to save their lives!! Isn't it amazing that us older hams actually got on the air with the old tubes rigs at all?? !!! We did OK, and not only survived with them, but thrived with them. You get on HF now with an old analog HF tube rig and are off 10 HZ and these new digital boys are gonna let you know it. IMMEDIATELY. About 10 of them will jump in there are tell you that you are off frequency!! In the old days we would simply reach down and turn the clarifier and not say a word and go on with the conversation. These new ones will look at you today and ask?? Whats a clarifier?? Amazing. When the only requirement to get a license now days is to memorize a few simple questions and answers and sign your name to the answer booklet to get a license I guess they had to come out with radio's like the 897, 1000 and 2000 with all those menus so the built in digital programs can tune the radio for them. For years I gave the CB'ers hell, but you know I actually owe them a big apology. They BEHAVE 100 X better than most of these new hams on HF. Just listen on ANY given night on 80 meters on say 3810 or 3843. Again, when they dummy down the requirements for a license just to attract people to the hobby in order to sell radio's, thats the kind of operators you get. As for my case, using the same antenna on different radios, I'm getting full S9 or more from local repeater (10km away) on my two other radios (an FT-60R HT and FTM-10R) but max to S4 on my FT897.

I would not get too bent out of shape concerning S-meters on amateur rigs.

Local Repeater Example:

706MKIIG = S-4 (S-7 with preamp on)
FT-8900R = S9+10
FT897D = S-9

All tests were done into a Comet GP15. I had also sent the 706 off to SAR Technical Services in MI to be checked out. Radio was tested and no problems what so ever were found.

No two meters on two different rigs are going to read exactally the same. Expecially if compaired to mono band rig.

Next question. Does it sound like a week signal, or is the S Meter just
off?

I assume you have the RF gain off, it isn't a bad patch cord and the
pre-amp is similar to the radio you tested with.

If the meter reading matches what you hear, then the front end has taken
a hit and needs to be repaired. See if you can get a signal generator
and get an s9 signal for 50uV of signal.

29687. RE: [FT897] FM S-METER TOO LOW

Yahoo group: FT897 (2010)
Date: 2010-04-10 20:10:42 UTC
From: Joseph Richard
Topic: 29650 Message: 29687

I agree the S-meter on the FT-897D is pretty interesting.

On my FT-897D a S9 is equivalent to -95dBm on 146.000MHz, -100dBm on 52.000MHz, and -99dBm on 444.000MHz.
S9++ is equivalent to -98dBm on 146.000MHz, -85dBm on 52.000MHz, and -92dBm on 444.000MHz

Device used to make the measurements an HP Radio Test set. FM narrowband, 1Khz audio tone, 3KHz deviation.

MDS: -126dBm 146.000MHz, -124dBm on 52.000MHz, and -126dBm on 444.000MHz. My method of MDS is the least amount of signal required for me to hear and tone.

On my FT-530 Dual band.
Full scale reading on 146.000MHz -100dBm
Full scale reading on 444.000MHz -101dBm

Well, hope that helps.

JR

29688. batteries & chargers

Yahoo group: FT897 (2010)
Date: 2010-04-10 20:13:48 UTC
From: ZephyrNYC
Topic: 29688 Message: 29688

Greetings everyone,

Ready for a dumb question? I'd rather find out the answer to this question via the group, vice finding out via smoke and flames ;)

I own several chargers for my motorcycle batteries. One of them is the fully automatic charger/maintainer, Schumacher SC-600A.

http://store.schumachermart.com/sc-600a.html

It can rapid charge at 6A, medium charge at 4A, and slow charge at 2A; and has a float mode and short circuit protection. Are chargers such as this model suitable for charging other types of batteries (to be used to power an 857D and an autotuner), such as the Buddipole A123, LiPO, LiFePO4, or other non-lead acid batteries? Or would attempting this result in a fire? ;) Thanks.

73,
Frank

Folks,

I am new to the group and have a question.

For whatever reason, LDG in their infinite wisdom only includes a cable to connect the AT-100 Pro II tuner to an Icom radio. I have a Yaesu FT-897. I see that K4SCH posted photos of the connection to the LDG AT-897 tuner. Does anyone know if the pinouts are the same for the 897 and 100 tuners? . Each end of the 100 cable has a 1/8" stereo phone plugs as shown in K4SCH's photo. I do have reason to believe it is not straight through and is likely as shown for K4SCH's 897 tun er cable. Thanks in advance for the help.

29694. W4RT Battery (need charger)

Yahoo group: FT897 (2010)
Date: 2010-04-10 12:39:38 UTC
From: Frank Krozel
Topic: 29694 Message: 29694

Just got a W4RT battery off the net, guy stated it was only charged a few times.
I was going to "test it out" but note it has a 6 pin connector to charge it (?)
Then on the power output side. it has 3 pin plug to go into the radio (?)
I did some quick look on the files side here on the Yahoo Group for 897 and believe this battery technology to be charged with "negative delta V" style.
Here is the question. I have several Maha 777 "Negative delta V chargers and want to know if anyone has charged these batteries before with a 777 or a negative delta V charger..
A quick look at W4RT's site did not reveal anything I can use to determine the pinout.
Ideally, I would like to plug this into my 897 and then wire up a plug to plug into the 6 pin, using negative delta v charger.
Side question, if I use this inside my 897 how does it limit to the 20 watts out that I believe it runs when I am running batteries.
Thoughts?

29695. CPU reset while transmitting

Yahoo group: FT897 (2010)
Date: 2010-04-10 21:00:32 UTC
From: kd6ftr
Topic: 29695 Message: 29695

This afternoon I was working a W4 station on 15m when, in the middle of my QSO, my radio did a full CPU reset, returning everything to factory settings. I have an LDG AT-897Plus tuner attached the radio with an LDG FT Meter for a little better/larger display. The SWR on the FT meter showed 1.1:1, my RF Power Set (No-075) was set at 100W and the radio is grounded.

Thankfully I previously saved the memory channels using Mac Memories Manager from Dog Park Software and was able to copy them back into memory. However, this is the second time it's happened.

Does anyone have any ideas or suggestions?

Hi,

I received my 897D a few weeks ago. I am looking at building the programming cable for this rig. Does anyone have a link or file that they can post that tells mw what I need and how to do it.

Frank, I can't speak to other non Pb batteries but you definitely do not want to try to charge the Li Po batteries with anything but the correct Li Po charger unless you're into to fire and explosion. They have their very own charging regime and take exception to anything else.

Greetings everyone,

Ready for a dumb question? I'd rather find out the answer to this

question via the group, vice finding out via smoke and flames ;)

I own several chargers for my motorcycle batteries. One of them is

the fully automatic charger/maintainer, Schumacher SC-600A.

http://store. schumachermart. com/sc-600a. html

It can rapid charge at 6A, medium charge at 4A, and slow charge at 2A;

and has a float mode and short circuit protection. Are chargers such

as this model suitable for charging other types of batteries (to be

used to power an 857D and an autotuner), such as the Buddipole A123,

LiPO, LiFePO4, or other non-lead acid batteries? Or would attempting

this result in a fire? ;) Thanks.

73,

Frank

From: Paul Graham
Topic: 29695 Message: 29698

Hello Mike,

897's seem to be rather prone to this sort of thing. Mine did a full reset quite some time ago. Also, A/B, I tend to use one for HF and another for VHF. I've found both to be on HF numerous times (including this week).
For me it seems to be RF in the shack, which I'm mostly prone to on 80m. Some times my radio also turns itself off. It only ever does this when I transmit, even though I'm limited to 50w.

Paul.

Subject: [FT897] CPU reset while transmitting

This afternoon I was working a W4 station on 15m when, in the middle of my QSO, my radio did a full CPU reset, returning everything to factory settings. I have an LDG AT-897Plus tuner attached the radio with an LDG FT Meter for a little better/larger display. The SWR on the FT meter showed 1.1:1, my RF Power Set (No-075) was set at 100W and the radio is grounded.

Thankfully I previously saved the memory channels using Mac Memories Manager from Dog Park Software and was able to copy them back into memory. However, this is the second time it's happened.

Does anyone have any ideas or suggestions?

From: P Grant
Topic: 29694 Message: 29699

Hello Frank,

I looked up the W4RT web page,,, it states that it is a 10AH, Ni-Mh battery pack, 9.6 VDC output. suitable for the FT817, and FT817ND, These are designed as QRP portable radios and with max Power on TX of 5 watts. It does not state as suitable for FT897 . Your FT 897 needs around 12 VDC to run properly ! !

The extra wiring on the charging terminals are for thermal protection and such.

Factory price advertised is 107 British Pounds = about $165.oo US.

Do a web seach for "W4RT MEGA-817" and have a read at the spec.

Subject: [FT897] W4RT Battery (need charger)

Just got a W4RT battery off the net, guy stated it was only charged a few times.
I was going to "test it out" but note it has a 6 pin connector to charge it (?)
Then on the power output side. it has 3 pin plug to go into the radio (?)
I did some quick look on the files side here on the Yahoo Group for 897 and believe this battery technology to be charged with "negative delta V" style.
Here is the question. I have several Maha 777 "Negative delta V chargers and want to know if anyone has charged these batteries before with a 777 or a negative delta V charger..
A quick look at W4RT's site did not reveal anything I can use to determine the pinout.
Ideally, I would like to plug this into my 897 and then wire up a plug to plug into the 6 pin, using negative delta v charger.
Side question, if I use this inside my 897 how does it limit to the 20 watts out that I believe it runs when I am running batteries.
Thoughts?

Hank,

If you want to work 2M SSB, 144.200 is the "Calling Freq" and that's
where the action centers. Also, look up SWOT, Sidewinders on Two, they
are a 2M SSB organization. Your 897 and a moderate antenna will get
around FL, GA, AL, and then some. And when E skip occurs this summer
you'll have some great contacts.
146.52 is an FM simplex freq.

29703. Re: New 897

Yahoo group: FT897 (2010)
Date: 2010-04-11 02:49:02 UTC
From: Hank
Topic: 29620 Message: 29703

Hello John, and thanks for the info. I realized my frequency mistake earlier today. While driving in my car with the xyl, I began thinking about people monitoring 146.52 while traveling, and how many of the 2 mtr rigs don't have SSB. So when I got home I looked at a calling frequency guide and saw that 144.200 was for SSB. So I will monitor that freq and see what happens.

I live in a deed restricted neighborhood, so my VHF/UHF antenna is an Arrow dual-band J-Pole in the second story attic. This antenna does very well. With 20 watts, I'm easily hitting repeaters 20+ miles away, so I should do quite well when e skip occurs. I plan on building a VHF beam with a small rotor and put it in the attic for 2 mtr SSB.

Also, thanks for the info on SWOT. I am definitely going to look into them.

73,

Hank / KB4MTO

It seems that I was hijacking the original poster thread/question but anyway, for my case, this problem occurred few months ago after the rig was idle for few months. Bought it in 2007 and used it almost daily on 2m before I have a dedicated 2m mobile unit in my shack. As far as I remember, the last time I turned it on late last year, everything was okay.. no problem getting S9 on further away repeaters (now I need to put the squelch way down to get them). It was early of the year when I loaned my 2m mobile unit to my friend that I turned the FT897 on once again and found that I've the problem as stated by the original poster and I think one other owner in this mailing list. Nothing much I could do since Yaesu does not have it office here in my country, may need to ship it up to Hong Kong or Japan to get this fix I guess.

Regards,
Mohd/9W2TPT

Folks,

I am new to the group and have a question.

For whatever reason, LDG in their infinite wisdom only includes a cable to connect the AT-100 Pro II tuner to an Icom radio. I have a Yaesu FT-897. I see that K4SCH posted photos of the connection to the LDG AT-897 tuner. Does anyone know if the pinouts are the same for the 897 and 100 tuners? . Each end of the 100 cable has a 1/8" stereo phone plugs as shown in K4SCH's photo. I do have reason to believe it is not straight through and is likely as shown for K4SCH's 897 tun er cable. Thanks in advance for the help.

I just got an LDG AT-100 Pro-II tuner. When I first set it up with the cable to the FT-897D it would trigger the transmitter and tune-up. Now when I change to a new freq/band and initiate a tune-up, it will not trigger the xmitter. If I actually transmit on the said frequency, the tuner will go into a tune-up. It seems as if the tuner is not trigger the xmit in the 897. Anybody have any ideas what may be wrong?

Hy all agn,

thanks for sharing all experiences.

As far as I suppose, there is some SW mis-working, ie inside the processor configuration is some (now corrupted) data that make all working fine, s-meter included.

Infact I'm not claiming rig FM sensivity, but only s-meter readout.

I know that on Service Menu (not accessible normally) there is a parameter that sets 2meter FM s-meter level.

I understand the interest in homebrew, however, for about the same cost and less time you can buy one from http://www.kawamall.com. I bought one from them and use it regularly on my 897D.

The best part is that is is a USB cable and can be used on most computers.

Thanks for the quick reply Paul. I thought I might have had a faulty component in the final amp or something.

Quick Q RE; the A/B. Do you set one up specifically for HF and the other for VHF/UHF and then you see that they both mysteriously end up somewhere in the HF bands?

> For me it seems to be RF in the shack, which I'm mostly prone to on 80m. Some times my radio also turns itself off. It only ever does this when I transmit, even though I'm limited to 50w.

Thank you for your response, however, perhaps I needed to be a little
more specific: I meant the batteries internal to the FT897(D/no D).

I was wondering what typical operating times and power people get using
the internal batteries, on something like 2m.

From: d_t_emerson
Topic: 29459 Message: 29717

Thanks, Craig.

Looking at posts in this and other groups, there seems to be overwhelming evidence that the AM filter, CF1005, frequently goes bad. That also seems to be the case also in my own FT857D, purchased April 2008.

I noticed something in the schematic and filter data-sheets:

1. In the Toko data-sheet for an ALFYM455H=K ceramic filter, which is the type used as CF1005, there is the note: "DC Decoupling capacitor. We recommend connecting a capacitor ... shutting off the DC current."

So, the manufacturer recommends that the filter should only be AC coupled.

2. Looking at the FT857D (or 897...) schematic, the filter CF1005 is _not_ AC-coupled. The full diode DC switching voltage seems to be applied across both the input and output of this filter, contrary to the filter manufacturer's recommendation.

3. Looking at the similar CF1004 (SSB) filter in the FT897/857D schematic, the switching circuity is almost identical, except that there _are_ capacitors that block the DC to this filter input and output. I've not seen any failures reported for this filter.

If DC is applied to CF1005, against the filter manufacturer's recommendations, then occasional failures might not be surprising. I could well believe that some batches of filters may be more immune to failure from unwanted DC than others.

Did Vertex/Yaesu designers simply forget to include the DC blocking capacitors for CF1005 in the 897/857 design? If so, this might explain the premature failures of CF1005. If true, then a fix for a bad CF1005 filter might be simply to add blocking capacitors at the input and output, copying the schematic for CF1004. More to the point, adding the capacitors on a good filter might avoid a later failure.

I haven't yet tried this. Does it make sense? I'm likely missing something important. Does anyone know of a Vertex/Yaesu Service Bulletin that might address this point?

29718. RE: [FT897] Question on battery power

Yahoo group: FT897 (2010)
Date: 2010-04-12 06:01:46 UTC
From: Dennis
Topic: 29711 Message: 29718

Regardless if you are using internal or external batteries, what we don't know are several things...are you planning on talking or will you just be monitoring, if talking, for how long and at what power level (remember, the 897 limits you to 20w on ALL bands when using INTERNAL batteries)? AM, FM or SSB? These will make a difference as well.

So, you see, it will depend on how you will be using the radio. Monitoring takes less power than transmitting does. By the way, I would turn OFF the backlight as well - helps conserve battery power too!

Yes, there are instances where people use solar to charge batteries, but I do not believe that can be done with the battery IN the radio. I think you must remove it - I could be wrong. I have heard of people actually running the rig completely on solar as well.

I do not recall the specifications on the batteries, but YOU have all the figures to "do the math" to figure it out. You have the variables that we don't, so we cannot give you an approximate length of time the power will hold. If you know the amperage the radio draws when on, say, FM at 20w and you know if you will be transmitting or monitoring and you know the battery rating you can figure out the approximate amount of time you can run the rig on batteries

There was EXTENSIVE discussion about this very subject (well, batteries in general - but I think internals were covered as well) not too long ago - maybe 2 months ago or so - so you may want to check the prior posts and see if you can find them, as I am sure you may find the info you seek and helpful.

Not trying to blow you off, it is just that this sort of thing is NOT easily answered and with the little info you gave us to boot.

Good luck!

Dennis - N8BMB

Thank you for your response, however, perhaps I needed to be a little more specific: I meant the batteries internal to the FT897(D/no D).

I was wondering what typical operating times and power people get using
the internal batteries, on something like 2m.

its a little more than just monitoring. The Yaesu adverts say 8 hours
on 2 internal batteries with 5% monitoring a transmission (squelch open)
5% transmitting and 90% idle. So idle with nothing transmitting uses
less power than actually receiving a transmission.

You can charge A while using B and charge B while using A. You should
not charge a battery you are using (per documentation, technically its
possible but they advise against it).

Running directly off solar is possible but I would advise against it,
you should have at least a power regulator (charge controller) and a
battery. When you transmit you will draw a lot more current than just
having the radio on, as a result you can cause the radio to reset due to
the low current level or something else. Sure it might work, especially
to just listen but I personally would not rely on it. Even a small
battery that can work as a current buffer would be my recommendation.

29720. Re: [FT897] Question on battery power

Yahoo group: FT897 (2010)
Date: 2010-04-12 08:20:10 UTC
From: Richard Corfield
Topic: 29711 Message: 29720

I've run with external Limicycle NiMH battery packs which are similar spec (4Ah, slightly old now). A single pack did most of the RAYNET duty I was on working between 5 and 10 W mostly monitoring. Two packs did the event easily - most of the day.

Max power with internal batteries is limited to 20W.

NiMH do fail fairly suddenly, or put another way they hold their voltage to just before the end, so watch that voltage display. You'll have the coloured lights with internal batteries.

Battery changeover is via a switch on top of the radio. I don't know if it's seamless or not. I'd expect to power off then power on which isn't a problem.

You can run one and charge one at the same time.

If you can carry the extra bulk then an external gel-cell could be an much cheaper option.

The current draw of my 897 when idle is fairly high, higher than something like an 8900 which is a common RAYNET radio around here. It could be just my older radio - but there is a lot in there to be fair. I've never run off internal batteries so don't know what power saving circuitry would be engaged in that mode that I don't take advantage of because my radio thinks it has a good external supply.

I have flipped the switch and it has just worked. I have not done it
while transmitting and would expect some problems there, but if you are
listening you can just flip it with no downtime.

There must be enough capacity in whatever supply filtering it has to take out the spike - presumably some supply capacitor(s) which can power the receive circuitry for long enough but as you say not the transmit.

Do not go by what someone tells you on the net , use the manual at minimum .
Then figure for your self , like mentioned above , not enough details , use the detail in manual , printed on batteries [there are at least 2 manufactures , with different spec.s] and use ohm's law and a little calculation .
Just going by what some one tells you on the net , means that you have a high percentage opportunity of killing your radio and any other equipment .
I have been into alternative energy for about 30 yrs. , your not going to gather enough info , to not wreck your gear , in a couple of posts & res-pounces , watching people talk about batteries / charging etc. on multiple forums , I find that between 70 & 90% of the replies are wrong , that's where the high percentage of killing your gear is going to come from .
Its fine to talk about on any forum , but after gathering some idea's , sit down with the spec.s and do some simple math , and confirm what you think you might want to do .
I would suggest that you play with some thing simple [hard to kill] running off batteries , solar etc , get a feel for it before you plug a $700-$1,000 into something you do not know much about .
As an example a fully charge battery is 12.7 volts , the 897 [and most mobile gear] is meant to run on 13.8 volts , running something on low voltage is hard on it , same with too high a voltage also .

no it doesnt. If that is the case then there is no reason for this
mailing list since anything posted here is just instant death for the
radio. I refuse to believe that anyone who uses the internet and posts
on mailing lists only gives information that will fry a radio. I refuse
to believe that no one knows what they are talking about, except you of
course.

and most equipment is specifically designed to operate on a percentage
of that. While a vehicle that is running outputs 13.8v when the vehicle
is off its at 12v, are you suggesting that running it at 12v is going to
kill the radio? Oh wait this conversation is on the net, BOTH of us
cannot be trusted in anything we say because that means it will just
kill a radio right?

You quoted me in this response, as if you were replying to what I said
specifically, and I wonder what crazy thing I said that will kill a
radio.

From: josedouglas@yahoo.com
Topic: 29711 Message: 29726

One simpler, yet inefficient, way to go would be to use solar power to run a deep cycle battery, attach a power inverter to the battery and then run/charge radio that way.
I have run/charged laptops that way in the past w/o problems.
Our radio doesn't have the internal batteries, so we haven't had to go the inverter route.
The Yaesu turns itself off anyhow if it doesn't get enough volts...

Cheers and 73s from Mid Coast Maine,

Jose

29727. AT-100 tune up

Yahoo group: FT897 (2010)
Date: 2010-04-12 17:17:08 UTC
From: Roger Horton
Topic: 29727 Message: 29727

I also have the exact same problem except with my AT-897Plus. After changing bands it would not initiate the am transmit to accomplish the tune cycle. After a second try and a successful tune cycle it would work fine until I changed bands again. I sent the tuner to LDG for warr. repair. They said they could not find anything wrong. But they did do a software update (tuner is only 3 months old). When I received it back my original problem was fixed however I had a new one. Now after every tune cycle the transceiver (FT-897D) stays in the AM mode and I have to manually change to USB or LSB or CW. LDG has promised to send me a new chip for two weeks now but I have still not received it. Roger, K8CIX

Sorry Mohd,

with FT897 did you ever had RF loopback problems?

I mean, perhaps on HF freq, did your rig behaved strange and fuzzy in TX phase, with bad coupled antenna system?

If yes, can you remember if S4 problem occurred only after that event?

Roberto

29730. best places to buy wire for rooftop horizontal loop

Yahoo group: FT897 (2010)
Date: 2010-04-12 21:03:51 UTC
From: ZephyrNYC
Topic: 29730 Message: 29730

Greetings,

I plan on installing a stealth horizontal loop on the roof just above my 7th floor rental apartment for an 857D, but I need some tips from the experts (YOU). The plan is to go up and install insulated wire all around the exterior walls of the roof. I should've measured it the first time I went up to the roof a few days ago, but I didn't. (It was cold, windy, and brisk that morning; and the rising sun and gorgeous city view distracted me ;) The walls are at least 120 feet in perimeter. This wire would not be visible from the roof of our building unless someone were to lean out over the edge of the roof, or climb up my metal fire escape, which is how I gain access to the roof. Just below the top of one or more of the 4 exterior walls, there is a small "lip" under which I could attempt to slightly conceal small gauge wire if I so desire.

IIRC, insulated copper braid is the best wire for this application. Where are the best places to purchase quality insulated wire (chain and online stores)? I just got off the phone with Home Depot and they sell insulated copper braid that is approximately 1/2 inch in diameter that costs $2.27/foot. Obviously, I can go with a smaller gauge to save money and increase concealment. What is the best way to mount or stick the wire to the exterior walls? Lots of duct tape (less obvious especially if I spray paint or purchase it to match the exterior walls' color, but more risk of detaching)? A number of little brackets and screws (too obvious, but much less chance of detaching)? Brackets and masonry or concrete cement/glue (non-metallic glue)? The Home Depot person recommended as the best method using metal pipe straps screwed into the masonry/concrete exterior walls. I told him that I can't use metal straps because the wire is to be used as an antenna. I also want to avoid creating permanent holes as much as possible. If I do create holes for the straps, I'd be sure to repair them before I move out at the end of the lease. He did say that Home Depot sells plastic pipe straps that cost 69 cents for a pack of 5. For plastic, he recommends one bracket for every 16 or 18" of large diameter wire. However, this would require the use of metallic screws. How much RFI would such metallic screws create? Obviously I want to avoid creating RFI.

Would this type of antenna require a 1:1 or 4:1 balun in order to use an autotuner? If I remember correctly, this type of antenna goes with a 1:1. Thanks.

73,
Frank

29731. RE: [FT897] best places to buy wire for rooftop horizontal loop

Yahoo group: FT897 (2010)
Date: 2010-04-12 23:06:26 UTC
From: Dennis
Topic: 29730 Message: 29731

Most people just use 12 or 14 gauge wire for loops. Probably would work better and be better concealed.

Subject: [FT897] best places to buy wire for rooftop horizontal loop

Greetings,

I plan on installing a stealth horizontal loop on the roof just above my 7th floor rental apartment for an 857D, but I need some tips from the experts (YOU). The plan is to go up and install insulated wire all around the exterior walls of the roof. I should've measured it the first time I went up to the roof a few days ago, but I didn't. (It was cold, windy, and brisk that morning; and the rising sun and gorgeous city view distracted me ;) The walls are at least 120 feet in perimeter. This wire would not be visible from the roof of our building unless someone were to lean out over the edge of the roof, or climb up my metal fire escape, which is how I gain access to the roof. Just below the top of one or more of the 4 exterior walls, there is a small "lip" under which I could attempt to slightly conceal small gauge wire if I so desire.

IIRC, insulated copper braid is the best wire for this application. Where are the best places to purchase quality insulated wire (chain and online stores)? I just got off the phone with Home Depot and they sell insulated copper braid that is approximately 1/2 inch in diameter that costs $2.27/foot. Obviously, I can go with a smaller gauge to save money and increase concealment. What is the best way to mount or stick the wire to the exterior walls? Lots of duct tape (less obvious especially if I spray paint or purchase it to match the exterior walls' color, but more risk of detaching)? A number of little brackets and screws (too obvious, but much less chance of detaching)? Brackets and masonry or concrete cement/glue (non-metallic glue)? The Home Depot person recommended as the best method using metal pipe straps screwed into the masonry/concrete exterior walls. I told him that I can't use metal straps because the wire is to be used as an antenna. I also want to avoid creating permanent holes as much as possible. If I do create holes for the straps, I'd be sure to repair them before I move out at the end of the lease. He did say that Home Depot sells plastic pipe straps that cost 69 cents for a pack of 5. From: Michael Hughey
Topic: 29711 Message: 29732

How do you know that he isn't looking on other forums and comparing notes? It's not like you're legally RESPONISIBLE (correct spelling) for any advice (technical) that you might give him. Maybe you need to be cranky somewhere else and quit shooting down people because they don't know everything and have a question.

Subject: Re: [FT897] Question on battery power

Do not go by what someone tells you on the net , use the manual at minimum .
Then figure for your self , like mentioned above , not enough details , use the detail in manual , printed on batteries [there are at least 2 manufactures , with different spec.s] and use ohm's law and a little calculation .
Just going by what some one tells you on the net , means that you have a high percentage opportunity of killing your radio and any other equipment .
I have been into alternative energy for about 30 yrs. , your not going to gather enough info , to not wreck your gear , in a couple of posts & res-pounces , watching people talk about batteries / charging etc. on multiple forums , I find that between 70 & 90% of the replies are wrong , that's where the high percentage of killing your gear is going to come from .
Its fine to talk about on any forum , but after gathering some idea's , sit down with the spec.s and do some simple math , and confirm what you think you might want to do .
I would suggest that you play with some thing simple [hard to kill] running off batteries , solar etc , get a feel for it before you plug a $700-$1,000 into something you do not know much about .
As an example a fully charge battery is 12.7 volts , the 897 [and most mobile gear] is meant to run on 13.8 volts , running something on low voltage is hard on it , same with too high a voltage also .

Alan,

Have you got the Y-ACC cable in the correct way...Red end to the 897 and black end to the AT-100?

Just a thought.

I just got an LDG AT-100 Pro-II tuner. When I first set it up with the cable to the FT-897D it would trigger the transmitter and tune-up. Now when I change to a new freq/band and initiate a tune-up, it will not trigger the xmitter. If I actually transmit on the said frequency, the tuner will go into a tune-up. It seems as if the tuner is not trigger the xmit in the 897. Anybody have any ideas what may be wrong?

From: Eric
Topic: 29711 Message: 29734

To answer your Question on solar power. I built a small battery box using a car battery that runs at 13v Dc. This is the only power source I use instead of internal batteries for the 897D. I then got a solar panel to keep the battery charged while operating away from home. I used this for over a week while camping and it did just fine for daily use of the radio. I used both VHF and HF bands at full power if needed doing this.

29735. MFJ-929 auto-tuner simulator for linux/win

Yahoo group: FT897 (2010)
Date: 2010-04-12 22:49:43 UTC
From: iw2mxd
Topic: 29735 Message: 29735

Hi to you all,

I own my FT-897D since November 2009. Recently I bought also a MFJ-929 auto-tuner to be used with my V-Inverted dipole.
I'm quite satisfied with it, but to understand better how it works in details, I decided to write a program to simulate a L-matching network: specifying ZLoad (cables+antenna), L, C, and some other parameters, the application calculates ZIn and SWR (as seen by the RTX). The application can be used also to find out the best L/C values to match a specified Z load.

In addition, giving the measured L and C values (which can be directly read on MFJ-929 display) the tool estimates your ZLoad (cables + antenna) and giving some other inputs it can finally calculate your ZAntenna.

To analyze the SWR in the "L/C domain" (to evaluate the "complexity" of your matching problem) a LC-Chart window is present, while the Z-Chart can be used to get SWR in the "ZLoad domain".

For those of you interested in playing with it, a windows installer or linux debian (ubuntu) i386/amd64 packages are freely available here:

http://sourceforge.net/projects/ltuner/

I first used a reel of multi-stranded insulated cable, the kind found in mains cables, which I got second hand. I've since bought reels of enameled copper. I can't say which if either work better. In the UK CPC/Farnell are good for this kind of thing - or radio junk sales where people may have reels of cable hanging around.

29737. Re: best places to buy wire for rooftop horizontal loop

Yahoo group: FT897 (2010)
Date: 2010-04-13 18:50:06 UTC
From: ZephyrNYC
Topic: 29730 Message: 29737

Read this only if you're truly interested. It's long and boring. I warned you ;)

When I called Home Depot, I meant to say "stranded" and forgot the word, but instead said "braided", so the guy quoted me for braided wire LOL I thank you all sincerely for the corrections. Now I know what to ask for next time.

I'll check out Lowe's too, since I know they offer a military discount, and also the places that you mentioned. A couple of you good hams also offered to sell me some of their extra wire at good discount, which I'll also strongly consider.

I was way off on my eyeball guestimation of the perimeter around the rooftop's external walls last week. I just measured it a few minutes ago-- 332 feet or 101.1936 m around the perimeter, which is now approx. 5/8 wavelength of 160m, 5/4 or 1 1/4 wavelengths of 80m, and 2.5 wavelengths of 40m. What kind of propagation should a horizontal loop of that length hooked up to a tuner be expected to achieve? I'll open up the Antenna Book after I unpack it from one of the many moving boxes.

The most horizon I can see from the roof is to the east, which is almost completely unblocked. (Hello, Europe! ;) I can see the northern horizon but some of it is blocked by other buildings. (Don't worry, New England and Eastern Canada ;) I can't see the horizon directly to the south and west, but the buildings in those directions probably offer less than 15 degrees of takeoff angle till I see sky to the south and approx. 45 degrees to see the western sky. (Sorry guys.)

I didn't find any good attachment points for plastic cable ties. It looks like I'll go with masonry staples, since the walls are made of brick.

I doubt I'll be able to feed the antenna with twin lead because there are only two sets of windows in my apartment:

1. One end of one set (where I want to set up shack) opens up to the metal fire escape, and the window on the other end has a metal grate in front of it. I'll probably feed coax through here. The window frames seem to be made of aluminum.

2. The second window is in the bedroom (where I don't want to set up shack). One side is also covered by a metal grate. The other side isn't, and is the window most distant from the metal fire escape (approx. 18.5'). If my only choice was balanced line, I would feed it

through this window. I plan on purchasing one of the window feed through accessories made by MFJ.

Once again, I thank you all for your help.

73,
Frank

29738. FIX THE FAULT: FM S-METER TOO LOW

Yahoo group: FT897 (2010)
Date: 2010-04-13 21:04:08 UTC
From: pavanroberto
Topic: 29650 Message: 29738

Hy all,

finally I found & fix this fault.

Problem, as suspected, was due to corruption of 2 parameters on the service menu (hidden, for technicians only).

Here details:

- go to service menu (! at own risk)
- parameter 010 FM-FS: found value 0 (default should be 111)
- parameter 011 FM-DISC-L: found value 0 (default should be 51)

Now with default values set, s-meter reading is fine agn.

Really I'm very astonished seeing this corruptions could happen on Yaesu Rig.

I would like to know the root reason (SW bug, RF loopback etc.).

Hope this could help others on same situation.

73, Roberto

Hello Denis;

Just took an antenna class. And that subject came up. Use a solid wire. 14 guage or so.

check with irrigation supply stores. they carry 14 guage wire for connecting irrigation valves with a controller.

Should work

Tony

29740. TX inhibit on CAT port ?

Yahoo group: FT897 (2010)
Date: 2010-04-14 04:51:51 UTC
From: Erwin
Topic: 29740 Message: 29740

Hi all,
I see that there is a TX inhibit at the CAT port.
How is this TX inhibit switched ? Is it TX inhibit to ground connection ? And what will be ? If the TX inhibit is not switched there is no power out ?
Do not really understand that because no more information about that in the manual. Want to use that TX inhibit for additional contact to my sequencer input to protect my preamp.

To let you know what I found out maybe someone needs it one day:

nhibit need pull-up resistor to +12V (1K-10Kohm is fine). This pull-up says to radio to use inhibit input (radio has weak internal pull down on inhibit input). Than when inhibit is grounded Pout is generated.

- Connect resistor between INHIBIT pin and +12V pin (+12V output is present on CAT connector)
- Pull wire from INHIBIT pin (where is connected one end of the resistor)
- When this wire is grounded, transceiver put out power. If not grounded, Pout is zero.

29742. For Sale: FT-897D w/Extras

Yahoo group: FT897 (2010)
Date: 2010-04-16 01:26:43 UTC
From: w6ur
Topic: 29742 Message: 29742

Hi All,

I'm going the SDR route so I'm selling my very nice FT-897D ser# 4Gxxxx which includes the following options:

FP-30 internal power supply w/original bottom cover, 300 Hz CW filter, LDG FP-meter, RT Systems OBP installed in the MH-31 mic, all cables, original manual and original box. Everything in excellent working condition with no issues, full output on all bands, non smoker. Cabinet is an 8 out of 10 with normal wear. Price $1000.00 postal money order only, will split shipping from 93306.

If interested please contact me off line. w6ur@...

Thanks,

Lou - W6UR

From: n0kwa
Topic: 29744 Message: 29744

I was using a straight key on my 897 the other day. The radio stopped transmitting in the middle of a transmission. All of my contacts and connections appear good. The radio works fine in all phone modes still.

Has anyone else experienced this problem? If so, how was it resolved?

Thanks,

Jim

I had a similar problem. In fact when in keyer mode neither dot nor dash worked.

My problem was traced to the failure of 2 tiny surface mount resistors in the keying line. My local Yaesu dealer fixed it in their repair shop.

My best guess about the cause is an incidence of RF in the shack during some tests and a not-so-well shielded cable between the key and radio.

29749. No Transmit

Yahoo group: FT897 (2010)
Date: 2010-04-14 22:15:37 UTC
From: ei9feb
Topic: 18894 Message: 29749

I tried:
mic (works on FT817),
key
CAT

It just sits on Receive, normal audio, green LED.

user manual factory reset makes no difference.

It worked for a while after being left, but on trying a week later it is same as before.

Well charged 12V lead acid battery.

No loose cables inside.

The "Service Menu" settings are all similar to published typical settings.

Anyone any idea?

Look here for the pictures:

http://groups.yahoo.com/group/FT897/photos/album/1143153966/pic/list

I've been running the same set of battery packs for quite a while and they're both working just fine. I went ahead and ordered the real connecting plugs for the battery to radio interface.

it looks like air flow might be a problem, how is the temperature of the
radio? What is the Tx duty cycle for that temperature?

From: Steve Yates
Topic: 18894 Message: 29753

Turn off the radio and unplug everything but the power source and antenna. Turn the radio back on and see if it will transmit. I've had mine do weird things when the key plug was half plugged in when the rig was turned on. If the rig gets an usual input when it is being turned on it can be placed in strange modes.

Hopefully your problem is that simple too.

From: G0JLX
Topic: 29744 Message: 29756

Jim, the answer may lay with the type of jack plug you are using for the straight key.

Are you using a mono one ? i.e. only two contacts, body & tip ?

If so, you will short out the 5V on the 'ring' connector of the socket, eventually causing a failure of the keying circuit.

Even if you use only a straight key, the 897 demands you use a stereo type jack plug (i.e. body, ring, tip) and connect only body & tip.

Hope that helps.

This is not correct, both tip and ring contacts on the key socket go directly to the processor via 1k resistors, the circuitry is the same for both.

Hi

There is a 2 metre AM net once per week.

I have recently joined and although they could hear my transmission, they said something was wrong and I couldnt qso with them. They were not able to understand what I was saying.

Listening to my AM transmitted audio on a receiver - I turned up the AM mic gain, changed from the stock mic to another mic it made an improvement but only very slightly. Still they could not hear me properly on the net - saying my transmission was very muffled and rough round the edges.

After adjusting the AM carr setting in the hidden menu - this made the biggest positive improvement - but now only about half of the ppl on the net can understand what I am saying. Still many reports of terrible transmitted audio. The people who can understand me say the transmitted audio is terrible.

Any ideas how I can fix this ?

Kind Regards - Simon

I'm still baffled.

CPU / software bug?

nothing connected except PSU/Battery and dummy load.

Tried Mic, jack and CAT cable in turn. All work with FT817ND.

sits with Green RX led on and RX on speaker. :-(

29765. band switch glitch

Topic: 29765 Message: 29765

Hi folks, I had a problem with my brand new FT897 D today.I was on VFO B on 7 Mhz just listening.I then pressed the band UP button and the radio jumped to 10 Mhz ..fine...I then pressed BAND UP again but the radio jumped back DOWN to 7 Mhz ! I then pressed BAND DOWN and the radio jumped back UP to 10 Mhz ! and so on it went back and forth between the two bands no matter which band button I pressed.
I was not transmitting at any time and VFO A seemed fine.
I kept on pressing BAND DOWN over and over and eventually the radio put itself right.
Anybody have a clue what has happened please? I have searched the archives but haven't found any similar problem.
I did have a digital interface plugged into the data socket at the time if that makes any difference?
best wishes...
lee

Did you use a horizontally polarized antenna? You can have as much as a 20db loss due to cross polarization.

Simon:

Be sure you're not transmitting any more than 25W on AM. Also, be careful with the mic levels in AM (see setup menu 005).

Since I don't know if I've every used my 897 on 2M AM, I just checked it out with my service monitor. I don't see much improvement in modulation past a setting of 20 for AM Mic level. At that level, with our without the mic processor on, the audio sounded pretty good. Trying to push it much past that started to result in some distortion. I did think the radio sounded better with the Processor on, but again watch the level.

All of this will depend on you voice and the mic. I have noted that it's not a good idea to speak straight into the MH-36 microphone (if that's what you have) but rather across it.

I'd suggest starting with the mic level trimmed way back (10) and then bring it up till people start to report degraded audio.

Of course, it's entirely possible there's some other problem with your radio or there's RF getting back into the radio, which can also cause a problem.

You will likely have to:

* put a ground strap on the hood to the frame
* ground strap on all the doors to the frame
* hatch to the frame
* exhaust system to the frame
* Make sure you have a good braid from the radio to the frame
* SWR won't really tell you anything to help solve this problem unfortunately
* See if you can find the 'brains' for the Dodge and make sure it is well grounded
* Make sure the Coax doesn't run parallel to any vehicle cables that might be connected to the brain

Spend some time reviewing http://www.k0bg.com/ especially http://www.k0bg.com/ground.html. He has done an amazing job of discussing HF in vehicles. Sadly, there is no quick answer to your problem. You just have to try things and see if it goes away.

Anyone who does HF mobile needs to bookmark this page.

Not knowing exactly what all the circumstances are, I suspect your mike gain may have been set too high. You did not answer the question about the antenna polarization. I suspect you tried to compensate them not hearing you by turning up the mike gain. Maybe someone else would like to weigh-in on this.

N0BND:

It's all about keeping RF at the antenna and away from your car wiring. Others have posted some good ideas, but I would reinforce any comments about putting chokes on any antenna cabling that comes from the antenna into the car or runs below it. You want to make sure that RF stays at and near the antenna. Put one or more chokes on any coax cable that runs either to below the car, or into the car. Same for any other cabling near the antenna. The coax shield should be well connected to the outside of the car body (or effectively the same) at the antenna. Don't run another ground from the antenna feed point down under the car to the frame or anything like that as that may result in RF being coupled into other nearby vehicle cabling. (A point where I'm sure I'll get disagreement, but am sticking to it. Simply put, no wire of any length provides an RF ground--it's an antenna.)

I am not the one with the problem. However, having the wrong polarization will not affect the quality of the audio. It will affect someones signal strength though by about 20db.

I would assume you thought he had a week signal and tried to driver more that 25 watts from the radio.

All that aside, the person with the problem needs to listen to himself with another receiver while he transmits into a dummy load.

Hi Bob

I have the THP HL-1.5KFX. I love it, plain and simple.THP provides a cable from radio to amp, so not to worry.
It is completely automatic. Bandswitching etc.
If the SWR exceeds 80 watts reflected, it shuts down FAST and I mean FAST. Faster than my MFJ-998 tuner can bypass the amp.
When this happens, a red light comes on indicating that you have to power down the amp and repower it (ON/OFF Switch).
If you want to run RTTY at power levels higher than 400 watts you should buy their external bolt-on fan.
Any more questions, just let me know.

Iam getting a Tokyo Hy Power next week, just wanted to know if anyone has one.

Also what is the interface or the connection between the radio the amp?

I really dont want to damage the radio or the amp. Any help is greatly welcome.

29784. AM-2 meters, Power/Modulation

Yahoo group: FT897 (2010)
Date: 2010-04-19 14:22:12 UTC
From: kc3vobob
Topic: 29784 Message: 29784

When operating AM on the FT-897, maximum AM carrier power, (Indicated RF power, without audio) is about 25% of maximum FM or CW power, for the band in question. Since maximum FM power is 50 watts on 2 meters, your maximum AM carrier power is 12 to 15 watts (about 12.5 watts) mike settings of 30 to 60% usually give good audio with the stock mike. Setting carrier power higher than 15 watts destroys 2 meter AM quality. There is an adjustment for AM carrier in the service menu, but never access this menu unless you have a regulated 13.8 volt power source connected, as the voltage used is critical to the calibrations in this menu. (Power control should be preset to maximum, mode to AM, mike to zero, band to 2 meters--access the carrier set menu, transmit, and turn the tuning dial to set for 12.5 watts output carrier level, into a good dummy load and wattmeter. press "function" button to save, turn off the power. When powered up the next time, maximum AM carrier should return to 12.5 watts. Now set the AAM mike gain to 50% and test it out-audio should be good! (Peak power, with audio, should be near 50 watts if you have a peak reading RF meter.)--73 KC3VO, Bob Curry

If 20 watts from your hamstick upsets your vehicle electronics, I hate to think what might happen if you were in traffic near me, while I transmit from my mobile, with 1,500 watts! It seems that RF suppression, shielding, and grounding must have been ignored in design and construction of your vehicle! This could be considered a traffic hazard, similar to TOYOTAS throttle/computer problems! I would notify the manufacturer, expressing concern about effects from RF effects of nearby transmitters, such as might be experienced when in traffic next to a full-power ham mobile, or driving past a military or commercial high-power transmitting antenna, as well as the ability to operate your own radio without problems. You cannot predict or control RF sources that are nearby/adjacent to your vehicle, so designed-in protection and immunity from problems should be REQUIRED!---73, KC3VO, Bob Curry

Sean,

I have found the "clarifier" knob to be very useful in helping "understand" what other stations are saying. It is certainly no substitute for a 2nd IF filter, but used in conjunction with a 2nd IF filter it can be veru useful.

Hope this helps,

What you are describing is an off-frequency SSB signal. I suspect you are using the MEM/VFO knob to tune. Remember this tunes in steps (which you can change to 1.0, 2.5 or 5.0 KHz, menu item 82). Use the Main tuning knob to zero in on the frequency. The Clarifier (or RIT, Reciever Incremental Tuning) will offset the receive frequency by + or - 9.99 KHz, but it leaves the transmit frequency where is was. It is not a fine tuning knob.

This is exactly why Europe has such stringent requirements for CE marking. Susceptibility to RF fields as well as not causing undue interference has been a requirement over this side of the pond for many years.

There's a real irony however, we finally have stringent requirements so that TV sets aren't effected by amateur transmissions when along come plasma TVs and a host of switching PSU technologies that cause interference to us rather than the other way round.

I hate to think what the V/m would be with a 1.5kW signal!

Gary & all:

So, how much coupling can there be at 60 Hz into a vehicle? I don't even accept that the E-Field gradient is sufficient to do that. The car would have to have a pretty good "Antenna" to foul things up driving under power lines. Since NASA's getting involved (perhaps debugging vehicle accelerator systems will generate enough revenue for them to stay afloat) I say we blame it on Gamma-Ray Bursts!

Dan,

The higher the frequency the shorter the wavelength. 60 Hz is a non issue. RF can and does get into Telephones, radios, stereos, TVs, touch lamps (been there done that) why not car electronics. Your Hemi may be prone to RFI . I should fire up my amplifier and sweep through all my available frequencies to see if you have any anomalies. Maybe I'll find the problem before Toyota?

I bought $700. of floor tile today for the kitchen and laundry room. Now I have to find the time to install it.

I have a broken spring in my Ruger 22 pistol. I place an order with Ruger today to replace all the springs.

Phil:

Yep, and I do drive a Hemi in my Durango. So far no problems at 100W on any frequency I've operated.

I agree with you on the higher frequencies. When I used to run an MA-1000B amplifier in my car, there were certain types of cars I could guarantee I could stall by transmitting right next to them at a stop light. What I was pointing out was that blaming this on power lines didn't seem rational. There's plenty of RF energy sources out there that are much more likely--assuming that EMI is in fact the problem at all.

I wonder if there was a Ham near each instance of the Toyota acceleration issues. Could you imagine the damage to our hobby if that was shown to be the case? (can't believe I even brought that up)

One of the things I always do when I am contemplating a new car is ask about its EMC and if the dealer cannot answer he has to go away and find out for me before I'll even consider it.

Actually, my current car, a Kia Rio, was even easier as it actually states it in the owner's manual that it is immune for transmitters up to 100W, which is all I am interested in anyhow.

I know transmitting over 100 watts at 27.185 MHz near a VW rabbit of 1980's vintage will shut down their EFI, or at least in the 80's it would.

It doesn't seem to be disrupting the CAN bus output only the gauges and indicators. I have some hardline I could run externally and make sure it's grounded along it's path. As it is now the antenna mount is grounded with a strap running to the backgate hinge. The radio is grounded to one of the seat bolts. Time will tell.

Subject: Re: [FT897] Dodge RF Problems

I know transmitting over 100 watts at 27.185 MHz near a VW rabbit of 1980's vintage will shut down their EFI, or at least in the 80's it would.

That vintage did not have EFI injection. Mechanical except the fuel pump.

Ignition modules had no problems.

I owned 8 of them . Had no problems with FI or Ignition.

Hello Lou.
Many thanks for taking the time out to try to help me with this conundrum, but what I need is the full wiring diagram for the LDG-AT897 ATU (not the 'plus' version) as I have blown a resistor, numbered 'R15' on the circuit board.
Thanks again Lou.
73 Brian.

These are all quite high power levels for transmitting near to other people - the kilowatt one especially!

If we assume 2W/m^2 as a safe limit, then 1kW into a 6dB gain antenna (so 4kW ERP) will not drop to 2W/m^2 until you're 12.5 meters away if I remember the maths properly (ERP / 4*PI*r^2)

That seems quite short, so could do with double checking the field strength formula which I think is 7sqrt(ERP)/d which comes to about 35V/m which is much too high. As it's inversely proportional to distance I'd expect d to double to 25 meters to get something like the 18V/m I remember as being important. (It's now a little while since I did the exams and I don't have the material with me.)

In the UK we are told to reduce power when mobile transmitting if someone may be walking near the antenna.

- Richard

29805. FT-897D EME (Earth-Moon-Earth) Station

Yahoo group: FT897 (2010)
Date: 2010-04-20 12:19:57 UTC
From: Steve Yates
Topic: 29805 Message: 29805

As you may have heard, the club station KP4AO had the chance to use the Arecibo dish in Puerto Rico over the weekend for some 432 MHz EME contacts. Because of the size of their antenna many smaller stations could work EME for the first time.

I setup a small station using my FT-897D, a mast mounted LNA, a very small 6 element Yagi on a tripod, and a Mirage 1010 100 W amplifier. The pileups were huge and I wasn't able to get through this time but I did hear them pretty well. I thought I'd share some of my recordings just to show that the FT-897D can be used for even more fun! And my friends wonder why I didn't buy an Elecraft rig like everyone else. My Yagi is made by KLM but they are very easy to build for this frequency. See below:

http://www.wa5vjb.com/yagi-pdf/cheapyagi.pdf

The SSB phone signals were very weak but the CW and digital signals came through nicely as expected. The long duration JT65B transmissions made for some interested propagation studies. I didn't have the ability to decode the JT65B signals but they were quite loud.

The best recording for SSB is:

http://www.aa5tb.com/aa5tb_120.mp3 (ESP required)

The best for CW is:

http://www.aa5tb.com/aa5tb_124.mp3

For JT65B these two files give the best samples:

http://www.aa5tb.com/aa5tb_125.mp3
http://www.aa5tb.com/aa5tb_126.mp3 (sounds a test pattern)

All recordings from 'aa5tb_115.mp3' to 'aa5tb_127.mp3' are from Friday, Saturday, and Sunday.

It's pretty amazing when you consider it is about 249,000 miles up, bounces off a big dirt ball, what's left comes back 249,000 miles, and about 2.5 seconds later you hear the signal. 2.5 seconds at the speed of light is a looong way!

The elect mike needs the mike gain reduced a bit for most operators.

There is a small difference in output between them.

This can be true between almost any mike .

The MH-31 is used on many of the commercial Vertex radios . It is a good mike.

Dale

DE N7UVL,
Its "plug in". Careful, the it only fits right in one direction.
-Two plug-in spots-remember which one each filter is
plugged in to, so you can remember which one to switch
to./ga

Topic: 29817 Message: 29817

Hi,

Anyone tapped into the 1st (68.33MHz) or 2nd (455KHz) IF of an FT897 or FT817 and used a softrock?

I am thinking the 1st IF will need a V9.0 base with a FIN1002 and 20ppm Si570 LDVS version capable of >1GHz for the 4x freq at 273.32MHz would be needed but the 74AC74 would probably not cope at this frequency, so maybe go for an LO of and ADE-1 mixer route as per VHF converter.

Or

Use the 2nd IF at 455KHz and perhaps a V6.2 lite and a 3.64MHz crystal or a DDS and divide by 8.

From: chirpytom
Topic: 29818 Message: 29818

Hello Everyone.
I have an LDG-AT897 auto tuner that has failed? The unit was working really well, until for some reason it blew the R15 resistor, and as LDG do not send out schematics, (I have tried, in vain, to locate a schematic for it, LDG not very helpful!) I have decided to sell the ATU 'as is' hoping that some lucky person out there can make use of it? The offending resistor has been removed by a very capable 'ham' and cleaned the point of contact, leaving two tails, ready to reconnect whatever the needed resistor is. I am selling it as I have managed to obtain a new one.
I am unsure as to what price to put on this item, so if any of you are interested, then please make me a reasonable offer, as I really do not like eBay!
I am willing to send this ATU worldwide at the buyers cost, with a 'tracking' service, that way I will know it has arrived safely.
Thank-you for reading my mail and I look forward to any offers.

29820. Re: FT897 of FT817 and SDR RX

Yahoo group: FT897 (2010)
Date: 2010-04-21 15:58:20 UTC
From: W1AEX
Topic: 29817 Message: 29820

Hi Dom,

I tapped into the 455KHz IF of my 897D at the optional IF filter connectors and utilized a downconverter (455KHz > 11KHz) connected to the input of my soundcard to utilize Flex Radio's PowerSDR for reception. It worked out very well.

I used a 5.0V Programmable oscillator running at 1.776MHz and divided down to produce 466KHz which was then mixed with the 455KHz to produce an 11KHz signal for the soundcard. The schematic is located here: http://members.cox.net/w1aex.fn31/KE1GFdownconverter.jpg

Good luck with your project!

Rob W1AEX

Hi Dom,
By accident I found this website: http://users.skynet.be/myspace/mdsr/
looks like those guys are doing exactly what you want. They tap from 455kc and down convert it to 12kc to be fed in the line-in of the soundcard.
Hope this helps,
Bo

I feel vindicated.

More mystery - I hooked up my 706mkIIG with an RT-11 tuner to the same antennas and no problem up to full power. MFJ-259b says antennas are tuned good. Next I'm trying an atas on the 897 or 897 with RT-11. I'll report.

Hi Everyone,
I run a Yeasu FT-857 in a 2007 Dodge Ram Diesel and also ran it and a FT-100 in a 99 Dodge Ram Diesel with a High Sierra Sidekick and a ham stick at different time and 100 watts with no problem. I have a friend with a Dodge Durango V8 who runs the same radio with a Hustler ant. with no problems. We both run vhf at 50 watts with no problem. You most likely have a grounding problem with the EMC.

73's

Make sure your DSP is turned off in CW mode, if it's on and set for 60Hz bandpass, you have to be just about perfectly tuned to hear anything. Turn the VFO knob slowly in the CW subband, if conditions are good, you should hear some activity. When the green light on your rig turns blue you have zero beat the signal and you know you have the CW tuned in correctly.

Sometimes with very sensitive mics like the MH-59A8J you have to set them down to about 15%-20% or you end up with excessive drive.

Lee,

I had a similar experience on VFO A. I had been using the radio as normal, stepped away for dinner and when I returned and started to switch bands I found that I had two occurences of the 80m band and had lost one or two others.
Since the radio is designed to remember the last frequencies used for each band, and since the up/down buttons loop, I simply reentered the starting frequencies for each band again (in the proper order of course).
That fixed it, but I couldn't point to what had happened.

A good sign as it would imply that RF is not the problem. I assume both radios were running off the car battery, so the problem could be interference carried back through the supply wiring.

Maybe a grounding problem or "RF in the shack" with a badly out of balance antenna. You could try wrapping the supply wires as a pair around a ferrite ring a few times. Also the same with the antenna feed wire. I'd normally say at the antenna end - but there's a tuner in the equation.

I've done this, though level out of the back of the radio can be high if you turn the volume up too much. A good idea is to use the DATA port on the back, either making up your own cable or buying one. You can still monitor the audio out of the radio speaker/headphone if you wish then, and level out of that port is not effected by the volume control so is consistent.

I used a male to male 3.5 jack from radio to sound card on computer. Both speakers & sub seem to work ok. Need to make some adjustments though. For some strange reason, I only get feedback when transmitting on 2M. 440 & 10M, no feedback. Might just go back to the single speaker, and scrap the computer speaker setup. I also finally got HRD to playback recordings. I would like to use the computer speakers, but the feedback is unacceptable.

Topic: 29776 Message: 29837

I'm just musing here - but great speakers for listening to music can be horrible for radio. Speakers made for communications generally have a strong mid-range but not much high or low. Speakers for music can make QRN and static bursts more intense. The 897d - in my opinion - is a bit noisy to begin with and adding high fidelity speakers can make that worse.

What a person wants to hear with communications equipment, on SSB at least, is the voice. And you can often hear that best with communications speakers.

Like I said, I'm just talking here, obviously the best speakers for a radio are the ones a person enjoys most. And what bothers me may not bother others.

Subject: [FT897] Re: External -vs- Internal speakers

I used a male to male 3.5 jack from radio to sound card on computer. Both speakers & sub seem to work ok. Need to make some adjustments though. For some strange reason, I only get feedback when transmitting on 2M. 440 & 10M, no feedback. Might just go back to the single speaker, and scrap the computer speaker setup. I also finally got HRD to playback recordings. I would like to use the computer speakers, but the feedback is unacceptable.

Yeah..just what the heck do you know??!!

Just joshing ya.......

A simple solution to the audio range and high quality speakers, is to go to
Radio Shack and buy a cheapo audio equalizer (
http://www.radioshack.com/search/index.jsp?kwCatId=&kw=audio%20equalizer&origkw=audio%20equalizer&sr=1)
and use that to 'tailor' the audio characteristic that is most pleasing to
one's ear. I imagine eBay has a few cheapos as well.

29840. balanced line & metal-framed windows

Yahoo group: FT897 (2010)
Date: 2010-04-22 21:31:34 UTC
From: ZephyrNYC
Topic: 29840 Message: 29840

Hello, everyone. Does anyone in the group feed an outdoor antenna with twin coax or regular (non-coax) balanced line going through a metal-framed window? If so, what kind of problems do you experience? AFAIK, using balanced line near metal is a big no-no, but I read this today:

Regular balanced line:

http://www.mail-archive.com/elecraft@.../msg30984.html

"... you can cross a metallic boundary with parallel feedline with no problem to the RF as long as it occurs at right angles to the feedline - again be careful that you have adequate insulation where you cross, the RF voltages can be quite high even with low or moderate power if the feedline has a high SWR."

And this on balanced (twin) coax:

http://eham.net/ehamforum/smf/index.php?topic=66987.0

"I would like some advice on feeding 450 ohm window line at right angles through aluminum siding. It's the only way I can do it! Can I get reasonably close at this right angle? or do I need several inches around etc."

"If you want to be entirely safe about it, you could change the ladderline to two side-by-side coaxes for the short final run through the siding and to the shack.

Connect an inside conductor of each coax to each of the balanced line conductors.

At the balanced line side, connect both coax shields together and solder. Insulate all three connections from each other well, using weatherproof tape or something suitable.

At the shack end, connect the two center conductors of the two coaxes to the balance line connects. Connect the two shields together and also connect them to shack ground.

This will create a shielded, balanced line that can cross conductive metals without problem. You could pass the two side-by-side coaxial cables through the siding through one tight pass hole or two, doesn't matter as they are now shielded but still running in blanced mode.

Old trick that works."

More on regular balanced line:

'But seriously, I'm sure you've heard that you have to "keep
ladderline several inches from metal."

Right angle crossings don't really count.

The important thing with keeping ladderline away from *metal* is that
you don't want to run it for a long stretch close to and in parallel
with a third unbroken conductor, because that turns it into a
different kind of feedline, one that has a lower characteristic
impedance and generally one that has more loss in the situations where
people like to use ladderline. So that's what you want to avoid.
And if you ran it very close to a long stretch of lossy, damp material
like dirt, the way the fields interact with the dirt would cause a lot
of very direct loss.'

More on balanced (twin) coax:

http://forums.hamisland.net/viewtopic.php?f=4&t=4793

Aside from differences in shielding, weight and cost; what are the
pros & cons of using balanced coax vs. regular balanced insulated
line?

Does RF from balanced feedline really cause interference to pacemakers
and other medical devices? I am curious because my apartment window
frames seem to be constructed of aluminum, and I have plans for an
antenna that will probably need a long feedline. The two windows are
approximately 4' and 15' from the edge of a metal fire escape.
Thanks.

I've got a pair of feedthroughs thru an aluminum window frame for passing balanced wire into house and never bothered to wonder about it til now :)

If you look at a balanced wire tuner you have parallel conductors coming out of a metal panel at right angles with no problem - not exactly the same, but I bet it works ok. 73 Scott

I use a pair of "shielded" Harmon computer speakers. ($25) These speakers have a tone control, more bass or more tenor, that I have found works like a DSP. I got a stereo splitter used so you can use regular head sets on airlines. It takes the 3.5 stereo jack and splits it into two mono 3.5 plugs. I plug one into my FT857D, and the other runs to my scanner. These speakers are amplified, but the bonus is, they run off of 12VDC. They also have a headphone jack on the front so hooking my headphones up is a snap. I have never had any feed back problems. For recording with HRD, I have my home brew sound card interface cable that I plug into the front jacks, (speaker and headphone) when I do digital modes, this allows me to "record" using the recorder in HRD, it just doesn't pickup when I transmit. I am working on a way around that tapping into my mic output.

Hi Group;

It looks like someone finally found our group. We are definably doing the 455kHz to 12kHz receiver with our own developed demodulator and spectrum analyzer. The hardware is called LIF2010 and it is available as a kit from our website. The software is called DADP (USB-LSB-CW) demodulator (it a free download from the MDSR yahoo group). The cost of the hardware is $25 + $10 for shipping. Guy (ON6MU) built this unit into the FT-897 and it works great for him.
Further more we are in the process to develop software for modulation inside the computer. A prototype for this is already working. It is called MDSR (Modulation -Demodulation Software Radio). This is no toy and I have made many DX connections via my FT-817ND in QRP mode.
So please check us out: http://users.skynet.be/myspace/mdsr/

Thanks;

Alex

29858. Introducing MDSR (modulation demodulation software radio) for FT-879 users

Yahoo group: FT897 (2010)
Date: 2010-04-24 03:34:48 UTC
From: alexschwarz237
Topic: 29858 Message: 29858

Hi Group;

The DADP is a software demodulator which was just recently tested successfully on the FT-897 by ON6MU. We take the 455kHz IF from the option filter port to create a SDR interface.
A 455kHz to 12kHz converter pugs into the audio card of your PC and with our own developed demodulator and spectrum analyzer you get SDR like performance. The hardware is called LIF2010 and it is available as a kit from our website. The software is called DADP (USB-LSB-CW) demodulator. The cost of the hardware is $25 + $10 for shipping and the software is a free download from the MDSR user group.

Further more we are in the process to develop software for modulation inside the computer. A prototype for this is already working. It is called MDSR (Modulation -Demodulation Software Radio). This is a full RX-TX capable software package and I have made many DX connections via my FT-817ND in QRP mode.
So please check us out: http://users.skynet.be/myspace/mdsr/

The whole development is done by HAMs for HAMs

Thanks;

Alex

29860. Frequency Adjustment

Yahoo group: FT897 (2010)
Date: 2010-04-24 16:35:38 UTC
From: Curt Givens
Topic: 29860 Message: 29860

A quick question - How involved is it to adjust the frequency on the FT897D? I found while running the calibration scheme for Winmore that I am off . I used the Fldigi frequency module to determine the "offset" and if it doesn't involve dismantling the radio and a kilobuck or 2 of test equipment I would like to get it adjusted.

Tnx in advance,

de Curt KC8STE/AAR5VR OH

I have a 2008 vintage 857D and had the heavy static, when the crashes went away I noticed that the RX was very wide in that I can hear the edges of other signals to the left and right of my frequency, regardless of my two filter selections of ceramic or 1.9 inrad. I now know for a fact that up the chain there is the ceramic filter which must have gave up the ghost and is now passing wide rx to the two I have. You will notice it is more difficult to tune in as you will get two signals in the passband at once and a funky sound when on a crowded band as if you are using an AM filter on SSB.

Hi Curt!
Don't fall into the trap where you try to get the freq to be very very accurate as it's like a dog chasing it's tail. You should be able to achieve better then published spec but unless your trying to win the ARRL award for freq accuracy, anything better is really a waste of time, once you think about it.

Being within 10hz (100 for VHF) good enough and anything more is dependent on temp, humidity and the cover being on or off as well as moon phase! Though my radio was withing specs, I spent allot of time to gain a little precision (from 5hz to less then 1hz) and really didn't make much difference in most all my ham radio activities.

Frequency alignment is a great way to understand the difference between precision and accuracy. I always had the accuracy, which is important for digital modes but I really gained nothing in having precision other then the piece of mind when making a CQ in PSK31 mode on 14071.12500Khz

Topic: 29864 Message: 29864

Have been using my 897D with great success for more than a year, even though I must use a screwdriver antenna inside my New York City apartment, with a counterpoise hanging out the window.

In the past couple of weeks, noise on the band has become so loud that I am no longer able to make contacts with other stations. The noise sounds like static--very loud crackling sounds: so loud I have trouble hearing the other station.

I know that band conditions have been bad lately, but does this sound like a band issue, or something else? I have checked every connection--from the antenna, from the power supply--and they are fine. If this sounds like a problem with the radio or the antenna, any thoughts on how I might rectify it?

There seems to be a trend on faulty 455kHz ceramic filters.

Yesterday, on a 897, I found a very low impedance input in one of them (220 Ohm compared to 2k nominal). This in turn generated that the switching diode which selects that filter (which was the 6kHz AM one) was always polarized, so the bandwidth, even in SSB, was 6kHz. One curious effect is that rig received in DSB instead of SSB. It is easy to check, as a fixed carrier is heard twice, both up and down the CW frequency, as you move the dial.

Best regards,

JOSE

This appears to be a common issue with the FT-897D after 1-year of operation. It happened to me as well as others on the group. When the noise appears, disconnect the antenna and you will still hear the noise. It will sound like static crashes and it will be on all bands.

I have had my FT-897 for about five years and have not had any of the problems you are talking about. I do have a G5RV lite in the attic due to covenants and a full size G5RV at the cabin and again never had the problem in question. I am interested in the solution should you find one.

This posting pertains to the static possibly generated in a 1 year plus FT-897. I have hed 2 of these rigs and both were more than a year old.
The one I currently use is a year and a half old and it works very well.
I have the standard noise, but it's the same on my FT1KD and my Drake receiver(s).
My question is Joe; what did you have done to your rig to correct the problem? A solution, if any, certainly would benefit anyone with this type of issue.

29871. S9 static crashes with no antenna attached - fix

Yahoo group: FT897 (2010)
Date: 2010-04-26 15:15:57 UTC
From: aa7fv
Topic: 29871 Message: 29871

From posts here and elsewhere, the AM filter in the FT897 and FT857D frequently goes bad after a year or two, especially in rigs made from 2007 to 2009. This produces intermittent lightning-like S9++ static crashes in the receiver, with or without antenna attached, and on all bands. The AM ceramic filter is a CF1005, a Toko ALFYM455H=K. Although worst on AM, the S9 crashes may couple into the filters used on other modes too. If the filter fails badly, it might also affect the proper switching to other filters.

There seems to be a Yaesu design error in the FT857/897 main board. The data sheet from Toko clearly states that this ceramic filter should be AC coupled, using DC blocking capacitors. There are no such capacitors in the Yaesu schematic. The full DC diode switching voltage is applied to both the input and the output of this filter.

If DC is applied to CF1005, against the filter manufacturer's recommendations, then occasional failures might not be surprising. I could well believe that some batches of filters may be more immune to failure from unwanted DC than others, so this failure mode might not occur in all rigs.

I had this problem in my own FT857D, purchased new in April 2008, after 23 months of operation. I have now added SMD capacitors (0.01 microF) in series with the input and output pins of CF1005. This blocks the DC voltage otherwise reaching the filter. This appears to have cured the problem, which is consistent it being a design error in the original circuit. I may have made the fix just in time, before the filter became permanently damaged.

This modification is not for the faint-hearted, or for those not experienced in SMD work. I was fortunate to have a skilled engineer friend (WA3HRM) perform the work for me, all under the microscope. I understand that the Vertex service center typically charges 1 hour of labor to replace this ceramic filter; considering what's involved, if that's true I'd rate it a bargain.

Good luck,
73, Darrel, aa7fv.

Yes, but this seems to be an apparent design flaw, which no matter how reasonably priced regarding repair, it is still an expense which should not be incurred. Yaesu/ Vertex or Yaesu/ Motorola should do a recall or not charge the customer for an apparent design flaw. This is the reason we pay such a premium for new age fancy digitally gizmo design radios.

I agree..... I purchased my FT897D used via on-line classified Ham radio web site. I noticed the noise problem 2 weeks after I had the unit (it was intermittent at times). I admit I got burned on this deal since I had to get the unit repaired. The original owner claimed it worked fine for him and he said he a technician check it out before he sold it which I thought was a strange statement. I could have purchased a new FT897D for what I paid for the radio plus the repair cost. So in my case I have more of an issue with a fellow ham selling a defective radio for at a working radio price.

Gordon, I had a lot of noise show up a few weeks ago and affter a lot of cussin' and head scratching I discovered that the power supply on the Linux box that sits under the table about 2 feet from the radio had suddenly developed a serious noise source problem, righ now it's shut down and unplugged until I have the time to dig into it. If you haven't you might try unplugging things to see if the problem goes away.

Did one of your neighbors get a plasma big screen by any chance?

Have been using my 897D with great success for more than a year, even though I must use a screwdriver antenna inside my New York City apartment, with a counterpoise hanging out the window.

In the past couple of weeks, noise on the band has become so loud that I am no longer able to make contacts with other stations. The noise sounds like static--very loud crackling sounds: so loud I have trouble hearing the other station.

I know that band conditions have been bad lately, but does this sound like a band issue, or something else? I have checked every connection-- from the antenna, from the power supply--and they are fine. If this sounds like a problem with the radio or the antenna, any thoughts on how I might rectify it?

Hello Phil;

I would not say you got burned.

My problem was intermittent. It was there for about an hour and would disappear for a couple of days. It appeared to trend with the weather until I disconnected the antenna. Then after a while, it just stayed there. It cost about $175.00 dollars, return shipping included, for them to repair the transceiver; approximately 1/5th of the cost of a new one. This is a listing of the parts which were replaced:
H3900542 (2) ceramic filter
H3900543 (1) ceramic filter
H3900386 (1) ceramic filter
G2070716 (1) diode
G2070592 (3) diode
G3070249 Transistor

I usually run vintage gear and I would have never noticed this problem had I not started using the 897D regularly. Perhaps the same could be said for the guy who sold the transceiver to you. I think in the interest of fairness, he could have offered to pay half of the repair bill. Just good business sense, but so many are just after a quick buck. When you really sit down and look at it, how long will the money last?

Take care and I am glad to hear your transceiver was repaired.

29878. Rt Systems USB cable issue

Yahoo group: FT897 (2010)
Date: 2010-04-26 14:32:46 UTC
From: Rich H K7RFH
Topic: 29878 Message: 29878

Looks like I am having an odd problem. Wonder if anyone else is seeing it as well.

Setup:
RT System USB cable plugged into CAT connection but not connected to the USB port on the computer.

Problem:
Turn on FT-897D and audio sounds distorted. When transmitting, PL tone is not generated for repeaters.

Fix:
Either remove RT System UsB cable from CAT port OR
plug cable into computer USB port, then all works fine

Conclusion:
The RT System USB cable is erroneously pulling down the FT-897D power level some how, if that is even possible.

Actions:
Contacted RT Systems and received additional question, but no response pass that. Not impressed with RT Systems customer support.

Switched back to serial cable and older software, this does not cause the problem.

Anyone have any advice?

Once I have loaded any info from my computer to the 897 I unplug the cable from the radio. Unless I'm mistaken, I believe that they say something concerning that their cable is only made for their software. Thay also say that any other USB cable most likely won't work on their software. I have had real good response from their tech dept. with software problems.

Hi Rich,

most likely it is pilling down the CAT lines due to the fact thet it isn't
being powered when it is not plugged into a USB port. The solution is simple,
don't connect it to the radio unless it is connected to the USB port of a
computer.

Hi Rich.

I have two USB cables from RT Systems; one for my son's VX8R and one for my VX5R. I like NEITHER of them. I found another company that makes USB to almost any radio interface. The company is called Kawamall and their web site is http://www.kawamall.com. When I first got the USB to CAT cable I had a couple of questions regarding its use with Macs. Approximately 10-15 minutes after I sent my email request to them I received a response. I've had nothing but favorable experiences both with the cable and with their support.

Also, the cable I bought from them is always connected to the CAT port on my LDG Tuner, which is always connected to the radio, whether or not I have the USB cable plugged in to a computer. Never had an issue. It could be the USB-serial converter chip that RT Systems is using that is causing the problem.

From: aa7fv
Topic: 29871 Message: 29886

Hi Joe,
That's a very interesting list of parts that were replaced. There are 5 ceramic filters in the FT857/897 altogether, CF1001 through CF1005. I assume they used the two H3900542 filters to replace both CF1005 (the AM filter that so often goes bad) and CF1003 (a narrow-band FM filter). In that case, the only ceramic filter they did _not_ replace is CF1001, which is part of the wide-band (broadcast) FM circuit, and which doesn't have any diode switching voltage on it anyway. It's hard to believe that all of these replaced filters had gone bad together.

I wonder if the Vertex service center may have started, as a matter of course, replacing all these ceramic filters in rigs sent in for repair, perhaps as preventive maintenance.

73,

Just curious,
For shack use, are you all using the foam windscreen, or leaving it off? Any performance difference?
Thank you!

The foam windmuff is a dual purpose device...obviously, the only 'wind' in the shack is us! I consider the muff as a spit guard. Keeps the mic clean, is easily washable, and inexpensive to replace, if needed.

It cuts down on breathy sounds - which are fine in an x-rated movie I guess, but not so much when a person is talking about RV and cornbread.

When I did commercial radio, the studio mikes had them. I guess it's still true today but don't know. I'm not too sure it's needed for SSB quality audio, but don't know.

Yes, I believe that is the case. If it gets power from the computer, all is fine. Seems to me there should be a way to wire the cable to avoid this situation.

My issue is that I created a "radio-in-a-box" and it is not a simple matter to plug-unplug that cable. I would also like to use the cable with HRD. I guess, if I don't get info from RT Systems I will need to reverse engineer a cable of my own.

Don't get me wrong. I currently own 4 different versions of the RT Systems software and found that their older version cable (serial) works well. Just think they are missing a great selling point. I have no problem with their software working only with their cable. But, they should allow their cable to work with other software and the cable should not interfere with normal operations.

If they did this, I bet more folks would buy rather than build.

IMHO

From: jfcbuk
Topic: 4851 Message: 29895

Hi
This may have been covered before so forgive me if I am asking somthing that has already been on here.
I have just bought a FT- 897D for portable use with the FNB-78 (2x at £190- $280) batteries do these charge up while the rig is connected to a power supply.
I also bought the CD-24 charger at a cost of £80 -$121 and now find I need to buy a PSU-26U also costing £80- $121 to be able to use the charger, This semms to be a hell of a lot of money to charge the batteries considering the radio cost £625- $947.
Can the charger be used with my 13.8v power supply if so which connections do I use.
and finally can the batteries be left in the radio while it is being used with the power supply
I look forward to any replies
Thank you
Jim

Ran into a similar problem, found that the interface is "software specific" and would work with the RT software and NOT WITH HRD.

Ditched the proprietary interface and software and purchased one of the HK USB interfaces that use the high end Prolific chip and have had no problems with the cable whether it's plugged in or not.

Used it on almost every software that you can download and it works.
Interesting USB cable it has plug in sections I use the same USB modual and now have "tails" for 897,817 VX families and even a Kenwood, they have almost the whole "Radio World" coverd, and its easy on the budget.
Have a look at 409shop.com for the multipurpose version.
Regards.

29900. Re: [FT897] Re: Rt Systems USB cable issue

Yahoo group: FT897 (2010)
Date: 2010-04-29 13:28:42 UTC
From: Michael Walker
Topic: 29878 Message: 29900

There is something unusual here, as the CAT port should not affect the Audio path at all in the TX or RX world. RT Systems likely can't help you as they have possibly not seen this problem before, so you really can't blame them.

My simple guess is some sort of ground issue. Either the USB adapter is missing a ground, or not all grounds are the same.

Is RF getting into the audio path somehow?

Is there a ground voltage differential between the radio and the computer without the USB cable connected or disconnected?

Do you have Audio from the radio connected to the computer as well?

Do you have CAT control when the USB cable is connected (I would assume so).

Is the audio distorted if you transmit into a dummy load with the USB cable connected? (distorted audio will destroy a PL tone)

What other cable connections are in place at the same time (I assume power - how is it connected, Audio for Digital modes, PTT, Ground)

Can you turn the RF power down on the radio and do the same test?

Take some time to describe the entire setup.

Thousands use the 897 CAT control at the same time with no issue. We just have to find out what is different about yours.

> I have just bought a FT- 897D for portable use with the FNB-78 (2x at £190- $280) batteries do these charge up while the rig is connected to a power supply.

A) No unfortunately they do not... at least not via the same connection. You can however connect the charger to them whilst running the rig from another source.

> I also bought the CD-24 charger at a cost of £80 -$121 and now find I need to buy a PSU-26U also costing £80- $121 to be able to use the charger, This semms to be a hell of a lot of money to charge the batteries considering the radio cost £625- $947.
> Can the charger be used with my 13.8v power supply if so which connections do I use.

A)The cheapest and easiest way is to buy or make another DC cable the same as the radio supply lead. If your PSU is up to it you can connect both cables to the supply then hook one to the radio power connector and the other to the mating white socket on the CD24. The coaxial socket on the CD-24 is for the moulded plug on the PA-26 though you could use that if it was easier for you.

> and finally can the batteries be left in the radio while it is being used with the power supply?

A)Yes they can! There is a jumper in the DC supply line which tells the radio that external power is connected and automatically isolates the internal cells.

By the way you were right, this has been asked many, many times before. If you scan the archives for FNB-78 or charging etc you will find much more about it than I know.

Kav

PS Dont you just love the UK price on these things? I got 3 Optima truck batteries for just a tenner a piece more. Mind you, they won't fit inside my 897 haha. Happy days!

29904. Notes on ATAS setup problems

Yahoo group: FT897 (2010)
Date: 2010-04-30 14:22:34 UTC
From: Edward Thorpe
Topic: 29904 Message: 29904

Hi gang. Sorry if this cross-posting gets you multiple copies of this but the content seemed relevant to all of these groups.

Over the past few weeks some of my ham friends have experienced frustration with their ATAS-100 and ATAS-120 antennas when used with FT-857 and FT-857D radios. We began a series of experiments using various FT-857's, Ft-897D and FT-100 radios to completely understand the similarities and differences. We have also noticed repeated questions about ATAS antennas in all of these groups. One of the group has documented our observations, one of the most important being the ambiguity in the Yaesu manuals. Here are the observations. We hope they may be of help.

Yaesu FT-857, FT-897 & ATAS-120/100 Operation Notes

If your ATAS Antenna used to work, but NOW for some reason it now does not, here are some ideas that I have been observed that I could not find in the manual .

Set your Control Head to read the TUNE - DOWN ? UP Display (Menu k on the FT-897)
Make sure your radio in an HF Band..NOT VHF or UHF
Press the TUNE button ?momentarily ? to make sure the word ATAS appears in Right Hand Side of Display
HOLD the TUNE button for more than a second and the ATAS-120 should start moving.
If it does not, you can press the mic PTT and press the DOWN or UP Button?If it does not operate you will have to momentarily press the TUNE button to make sure the ATAS word ? IS ? displayed.
Note that IF you are in the Allocated Amateur HF Frequencies the ATAS will be in Capitals. If the ATAS word is in LOWER CASE?. The Freq Dial is ?out of the allocated Amateur Frequency Band ?

If you momentarily press the TUNE button and you get the word INIT you should just WAIT for about 60 Seconds (sometimes a bit more) until the INIT disappears and the word ATAS appears. I suspect the CPU has been confused and has to re-initiate itself to operate the ATAS Antenna properly.

If you now follow the above steps, the ATAS Antenna should operate properly

This happened to me when I was testing a 2nd ATAS-120 Antenna. When I changed to the 2nd Antenna the ATAS operation did not work. The word INIT appeared, but I did not notice it. Things did not work even when I put the original (working) antenna back on!
After much head scratching and consultation with Ted VE3HPL, we

stumbled upon this operation quirk that I thought might be of interest to others.
When I first put the radio on the bench connected to a Termaline Wattmeter. I pressed any of the TUNE ? DOWN ? UP buttons, I got NO power output at all.
After noticing the INIT indication AND waiting for up to 60 seconds (or more) the INIT indication changed to ATAS. Then when I pressed TUNE the wattmeter pulsed up to about 10W and returned to zero. When I pressed the Mic PTT and DOWN or UP button the wattmeter indicated 10W.

During these evaluations, I happen to be working with the FT-857 with the DSP board ADDED and an FT-857D with DSP already installed. There are subtle differences in how the front control dials work! The FT-857D features are slightly more convienent but both radio function the same. VE3HPL's FT-897D controls are also slightly different.

Here is one additional observation that can leave you with a headache. Should you have the good fortune to mount your ATAS such that it will find a low SWR point and tune the first time you press and hold the TUNE button, you may find that things appear to work without having performed the initialization. This, however, is likely temporary. Also be aware that if you change the setup to TUNER or OFF then return later to use your ATAS you will need to perform the initialization again.

Hope this has been of some help.

29906. Re: Rt Systems USB cable issue

Yahoo group: FT897 (2010)
Date: 2010-04-30 02:09:03 UTC
From: Rich H K7RFH
Topic: 29878 Message: 29906

Mike-

I agree there is something unusual going on here. Hopefully, I can address your questions.

The situation occurs whenever I attach the RT Systems USB CAT cable to the FT-897D and it is not connected to anything else at the other end of this cable.

All grounds in the "shack" are confirmed correct.

It does not appear that RF is getting into any audio path, since the distortion problem occurs without any transmissions.

There are no audio cables connected.
The computer is not connected when the problem occurs.

The radio is attached to power.
The audio distortion occurs with any sounds generated through the radio's speaker (e.g. beeps)

Yes, CAT control works correctly for all apps when computer is connected.

Substituting a non-USB (aka serial) cable for the RT Systems USB cable fixes the problem.

So, it would appear that the only difference between mine and the thousands of others is this particular USB cable.

Thanks to all for your advice, comments and experiences. To my satisfaction, I believe the RT Systems USB cable has a "fault" that is causing the problem.

Topic: 4851 Message: 29908

Jim,

Your FNB-78 Batteries do not charge when you connect the FT897 to 13.8V DC.
You don't need the PA-26U if you have a 13.8V power supply. The PA-26U
allows you to charge your batteries household AC without a 13.8V power
supply. Not that usefull to me.
You can charge you batteries with the CD-24 from any 12 - 14 V source.
At home I use my Alinco switching power supply. Away from the shack I
use a solar cell. I'm not in front of the rig but from memory the
CD-24 has a Molex commector on the unit and a cable is included. The
cable was not terminated on one end and I put on Anderson PowerPoles
to connect to the shacks DC power supply.
Yes you can leave the batteries installed when operating with your
13.8V power. To install the batteries you have to take screws out of
the bottom cover. I feel they intended you to leave the batteries
installed all the time.

It's not cheep but I think it is a clean well thought out portable
battery powered rig.

I used to put my gain up to 85. I wondered the same thing so I emailed Bob Heil and they told me that the default settings are fine, so I put it back to 50. Workd fine, there was no difference between 85 and 50 from the reports I got.

The length is critical. If to long they can short out the circuit board and electronics.

There is normally a warning on this. My last radio had a warning sticker on the side of the radio.

I cut mine off with my Dremel grinder to fit .

The screws that you need are 4mm metric fine thread BUT only 6mm long. That is what the M4X6 means. Take great care that your M4X10 don't short anything out.

I have never seen a metric screw called M4-.07 X 10 before, I assume that the .07 meands fine thread, but this screw would normally be called M4X10 not M4X7.

29926. RE: [FT897] Cannot tune out of the ham bands

Yahoo group: FT897 (2010)
Date: 2010-05-02 15:46:15 UTC
From: Bruce Krell
Topic: 29923 Message: 29926

The problem with making hardware mods then doing a master reset is that you are mucking

in an area where you can't predict the side effects. The engineers at Yaesu designed the hardware,

then configured the software to match. You changed the hardware and did a reboot. Now, the

software configuration doesn't match the hardware configuration.

Probably the best approach is to start looking at the various parameters that you can set.

And, then experiment with changing these to see if you can find the modification that

fixes the problem.

Here's another possibility - maybe the hardware fix didn't go as well as you thought.

In otherwords, maybe the installation was easy but by doing the installation, you changed

something in the hardware circuits and processing that is causing the problem.

Is this a recently manufactured box? Maybe Yaesu made some changes that we don't know

about for the new boxes and the old hardware mod doesn't work anymore.

Here's an experiment - undo the mod, reboot, and see if the problem goes away.

If so, this tells you that the mod was indeed the problem.

Or, maybe it's just a simple parameter change and someone on this mail list has seen the

issue before. Hopefully, you'll be able to get a suggestion.

These are all possibilities. When you make changes, you take chances. Welcome to the fun of ham radio.

Subject: [FT897] Cannot tune out of the ham bands

I have a perplexing problem - grateful for some help. I perfromed the wideband mod on my new 857D (Feb 2010) - leaving it with jumpers 1007/8/9 and no others. Then did a master reset (home plus power-on). No chnage in anything except I had to reset the memories etc - i.e. I no wideband tx was available, but all else was as before. Then did a another master reset, and another, and now for some reason I cant receive outside of 144-146 on 2m, and 430-440 on 70cm. HF receive seems ok. I can tx in the ham bands - but receive is limited. The jumper operation went very easily and was checked with multimeter and magnifying glass - its the 3rd I have done - but not successful in this case. The limited receive thing is perplexing me the most!

Have I missed something obvious

Grateful for advice.

It is possible that Yaesu has made a change to the CPU and/or firmware resulting in a different jumper combination. It would not be unheard of. Looking in a Yaesu service manual, you often see different sub-categories for parts and alignment procedures based on the rev level of the radio in question. The fact that the radio is newly manufactured would lead me in that direction.

A suggestion would be to undo your change and see if the radio is restored to its former functionality. If so, then you are probably looking at a change in jumper settings. The only solutions then would be to either experiment with different combination's (a DIP switch setup is useful for that) or find someone with a MARS license who can obtain the information for you from Yaesu.

All,

American threads are designated by the number of threads per inch (e,g, #10-32 mans the diameter is #10 and there are 32 threads per inch). For metric threads they designate the threads by pitch rather than by threads per inch. In the case of M4, there is M4X0.7 (which is coarse thread) and M4X0.5 (which is fine thread). What this means is that the threads are spaced 0.7mm from on thread to the next.

The screws that you need are 4mm metric fine thread BUT only 6mm long. That is what the M4X6 means. Take great care that your M4X10 don't short anything out.

I have never seen a metric screw called M4-.07 X 10 before, I assume that the .07 meands fine thread, but this screw would normally be called M4X10 not M4X7.

Actually this is not quite correct for the FT-857D and FT-897D. Please refer top the circuit diagram and you will see what I mean. The CPU chip in the rig is programmed in such a way that the values feed out through a set of pins and then there are three optional paths to feed them back in. You have a choice of 1001-1002-1003, or 1004-1005-1006 or 1007-1008-1009. I suspect they did this to add versatility to the rig, since there are different band allowances in other countries (such as the UK for example) than in the US. The modifications essentially hook different output and input pins from the CPU together dependent upon which configuration you are trying to achieve. Based on your described performance, I am pretty sure you do not have the correct combination of jumpers. They are different for different ranges of serial numbers. I was authorized for the widebanding because I am a member of Army MARS yet they would not give them to me until I proved it by sending them a copy of my license. And then they mailed them to me with the caveat that I not give them out to anyone else. They are required to restrict this information by the FCC.

If you are authorized for this mod, then I am sure Yaesu will give you the information. If you are not, then you are on your own. You might be better off in that case putting the jumpers back the way they were.

You definitely do not want to be trying to change program parameters to fix this. The solution is to get the jumpers correct and then it will work just fine.

73,

Mike, AE8U

Subject: RE: [FT897] Cannot tune out of the ham bands

The problem with making hardware mods then doing a master reset is that you are mucking

in an area where you can't predict the side effects. The engineers at Yaesu designed the hardware,

then configured the software to match. You changed the hardware and did a reboot. Now, the

software configuration doesn't match the hardware configuration.

Probably the best approach is to start looking at the various parameters that you can set.

And, then experiment with changing these to see if you can find the modification that

fixes the problem.

Here's another possibility - maybe the hardware fix didn't go as well as you thought.

In otherwords, maybe the installation was easy but by doing the installation, you changed

something in the hardware circuits and processing that is causing the problem.

Is this a recently manufactured box? Maybe Yaesu made some changes that we don't know

about for the new boxes and the old hardware mod doesn't work anymore.

Here's an experiment - undo the mod, reboot, and see if the problem goes away.

I have just uploaded some sketches and notes on this mod, to
http://groups.yahoo.com/group/FT-857D/files/FT857-897_CF1005-fix.pdf .
Good luck,
Darrel, aa7fv.

--- In FT897@yahoogroups.com, "aa7fv" <aa7fv@...> wrote:
>
> From posts here and elsewhere, the AM filter in the FT897 and FT857D frequently goes bad after a year or two, especially in rigs made from 2007 to 2009. This produces intermittent lightning-like S9++ static crashes in the receiver, with or without antenna attached, and on all bands. The AM ceramic filter is a CF1005, a Toko ALFYM455H=K. Although worst on AM, the S9 crashes may couple into the filters used on other modes too. If the filter fails badly, it might also affect the proper switching to other filters.
>
> There seems to be a Yaesu design error in the FT857/897 main board. The data sheet from Toko clearly states that this ceramic filter should be AC coupled, using DC blocking capacitors. There are no such capacitors in the Yaesu schematic. The full DC diode switching voltage is applied to both the input and the output of this filter.
>
> If DC is applied to CF1005, against the filter manufacturer's recommendations, then occasional failures might not be surprising. I could well believe that some batches of filters may be more immune to failure from unwanted DC than others, so this failure mode might not occur in all rigs.
>
> I had this problem in my own FT857D, purchased new in April 2008, after 23 months of operation. I have now added SMD capacitors (0.01 microF) in series with the input and output pins of CF1005. This blocks the DC voltage otherwise reaching the filter. This appears to have cured the problem, which is consistent it being a design error in the original circuit. I may have made the fix just in time, before the filter became permanently damaged.
>
> This modification is not for the faint-hearted, or for those not experienced in SMD work. I was fortunate to have a skilled engineer friend (WA3HRM) perform the work for me, all under the microscope. I understand that the Vertex service center typically charges 1 hour of labor to replace this ceramic filter; considering what's involved, if that's true I'd rate it a bargain.

I think you have to bridge the 1006 jumper. For reset, with the transceiver off, press and hold in the [F] and [V/M] keys; while holding them in, turn the radio on. Take a look here: http://www.kb2ljj.com/data/yaesu/ft-897.htm

Group members,

All three of these radios look great, but I'd like to know why you chose the one you did, rather than one of the others. Or, whether you would make a different choice in the future, or perhaps you did revise your choice after an initial purchase?

Maybe it will make my choice more successful. Just lay it out like you would for someone who cares, 'cause I am getting close to ordering.

817 - 5 Watts? Are you a QRP enthusiast?
857 - No TXCO, weak DSP.

897 - Everything for a novice or veteran Ham and only $100 more than 857. Portable, mobile, or base configuration. Would not be caught alive without one.

I have six other radios, all Yaesu, but this is the one I pick up when I don't know what I might want to do on a radio "play day". The batteries are a must have investment if you are considering portable or emergency work. W4RT sells a OEM replacement that is much cheaper.

I've been offered quite a nice sum for mine but won't part with it unless there's enough to buy another one.

Thanks Mike, your points are well made. Regarding the jumper info though - I did get the info from the official source and was based on the model, batch and serial number of this particular radio. However I guess there could still be an error . . . I will try a temporary jumper on 1006 and see if that makes any difference, or I guess its back to the way it was . . . What has perplexed me though is that the tunable bands changed after a 3rd master reset (with the box staying closed!) - and so I cant tune out of the 2m and 70cm ham bands for receive purposes even. Hmmm.

Thanks to all who have responded.

I picked between the two (897 and the 857) because of the size of the controls and their spacing. I believe they are the same radio (electronically) otherwise. I would have liked to have the optional remote head feature, but it wasn't a deal breaker. I picked the 897D.

Justin,

I got mine directly from Yaesu and it seemed to indicate exactly what you stated. However, I found someone who knew what he was talking about that told me the information was a bit confusing. There is one additional jumper needed that is not easily understandable from the info.

73,

Mike, AE8U

From: jphillips.houtbay
Topic: 29923 Message: 29939

Sorry if this is a repeat - one of my postings seems to have disappeared. Thanks to all the great advice - I added a jumper over 1006 and bingo all the lights came on again - the mod has worked perfectly. the confusion appears to be that some 897s have 1006 lready set, and some dont. I thought this was to do with the Alaska emergency freq (which I dont need) but apparently not.

For those who are wondering what the mod is for - I am licensed for two experimental freqs in my country in the (not the US), plus three civil def freqs here in the 70cm band as it happens. Additionally, it could be a handy emergency SSB on my sailboat (which already has an ICOM M710 type approved set). It is fantastic to have all this capacity in one box, though it raises challenges on antennas as you can imagine.

Hi Darrel,

I tried to download your fix, but I get a response that the file is damaged and cannot be repaired. I was wondering if you could upload it again, or alternatively email it to me directly at yaesu@...

Regards,

Paul, AX2NFE.

I had an 817. A great radio but 5 watts can get to be frustrating and the small display and knobs can be a pain at times. And of course there's always the chance you get to join the blown finals club.

I bought the 897D and it truly is a rugged shack in a box. Want to work a little QRP dial down the wattage, need to bust a pileup crank it up. And the size of the controls and display are a lot easier on the eyes. Long term you'll probably be happier you spent your hard earned money on the 897 or at least the 857.

tom

I have had all three. Actually over the years I have had the 817 four times and keep trading up. At this time I don't have one. Maybe someday again, but for now I just got a used 897D and find it to be my best choice. The 857D has problems. because everything is so packed it tends to blow finals. The controls are too tight and the display too small. I traded mine (once yeasu fixed it a second time at $112 each time), for a IC-706 and was much happier. The 817 is one great do most anything radio, but really is a field qrp rig and many times when conditions were bad I really wanted more power. I have always had my eye on theh 897 and finally got one with the LDG tuner attached and the intenal power supply. I think this is by far my best universal radio. 5 watts to 100 watts. No external PS needed. Pull the plug on the back and connect to the car for mobile or to a battery pack for portable operation. HF/UHF/VHF will high and low power. Resonable size for much easier display viewing much easier button useage the the 857 or the 817. For me the radio is truly ideal for camping, home, car and emergencies. The 817 beats it for back packing and some outdoor activities, but not by much. Before I would ever recommed the 857 for anything I would suggest a used fully loaded 706MKII or MKIIG. You will be much happier. So that is my 2 cents work....FT-897+ LDG wide range tuner = fun and versatility that is hard to beat.

I agree for SSB but on FM (repeaters & simplex) I got the best results for FM mic gain at 40 and my GM 5 is on the PRO/Wide.

From: Dave Nelson
Topic: 29945 Message: 29945

As a couple of others have said the 897D is much more rugged overall
I have had mine for 5 years and have been very satisfied. In fact at the
moment
am doing a major modification to it. I am installing a Khune 1296MHz
transverter
into the unused (and for me never to be used) battery compartment. Along with
the transverter module there will also be a 1.5W power amp module and
appropriate RF switching relays and sequencer. I am looking forward to having
all in one package, a radio that goes from 160m to 23cm
I will post pix of the final product once finished
The large battery selection switch will select between normal and xverter
use.

The FT817 is am awesome low power unit and other than QRP use it is a
very popular transverter driver for various microwave bands. That fact
alone would
seriously tempt me to purchase one solely for that use, if I didnt already
have the
older Icom IC-290H for that purpose.

cheers
Dave

After a lot of research and comparison, I chose the FT-897D. The 817 was never an option for me as I don't do backpacking or QRP. Based on that, it had really nothing special to offer. If I did those things, the 817 would be my radio of choice.

I chose the 897 over the 857 because of size and the option of built-in batteries. I like the size and layout of the 897 over the 857. It is easier for me to see and the controls are spaced out, making it easier to operate. In my case, the rig is a base rig, so I also liked the optional built-in power supply. Plus, living in Hurricane Alley, I like the idea of the optional built-in batteries. With the built-in DSP and TXCO, it has everything I would ever need and more.

I have had my 897D now for about a year and a half, and I am very happy with it. I bought it with the LDG-897 tuner and the built-in power supply. Since then, I have added the LDG FT-Meter and the Yaesu MD-100A8X desk mic. With a compromise dipole antenna in the attic I am making contacts all over America, Central America, South America, and Europe, all on 50 - 60 watts.

From: john_kb0ne
Topic: 29933 Message: 29948

For me: the 817 and running QRP on all modes just didn't have any appeal. (Around here that turns out to be a good deciding factor, especially on V/UHF FM repeaters.)

The 857 looked way too SI-FI with the cluster of push buttons around the tuning knob and general faceplate layout.

The 897 appealed to me because, for me, it looked like a ham radio oughtta look.... still, it has lots of buttons but I figured they would be a bit less distracting operating mobile.

So one could say that between the 857D and the 897D, it was a fashion statement.... plus the 897D had a couple factory installed options that the 857D didn't have.

Just looking for some reassurance.

I just got my commercial GP-3 2m/70cm antenna up and I pulled power back to 30 watts and I can easily work the local repeaters. I notice something I didn't see on HF that I would like confirmation on. After even a 20 second or less FM transmit on 2m and 70 cm the fan immediately comes on. Unlike HF where I transmit SSB at 100 watts for longer and the fan doesn't come on. Is this normal?

David,

Don't forget that with s ideband there is no carrier. Watch the power meter when you talk on SSB. It will jump up and down in cadence with the mo dulation of your voice. When you key the mike on FM, you immediately are transmitting the full power of the carrier you have selected even before you modulate.

It's normal. The higher duty cycle of FM, even at 30 watts, will cause the PA heatsink to warm up more quickly than SSB operation.

I chose the FT-897, but only after carefully looking at each radio's capability. I'm a hiker, so I initially wanted the FT-817 for it portability and light weight, however it's max pwr out is only 5 watts on all bands on it's internal batteries. The FT- 857 is smaller than the FT- 897, puts 100 watts on HF, 20 watts on UHF and 50 watts on VHF, however it's not portable unless I want to put some heavy gell cells in my backpack. I ultimately chose the FT 897D for it portability and power. It has the same power as the 857 when connected to 12 volts dc and has 20 watts on all bands when on either of it's two optional internal batteries. I did use a 12 ah AGM battery in Golden Gate State Park in Colorado last summer for about 10 hours on 15 watts on VHF with an Arrow dual-band J-Pole during a marathon and it only used 33% of the battery by the end of the day. I would choose it again.

I had an 817. A great radio but 5 watts can get to be frustrating and the small display and knobs can be a pain at times. And of course there's always the chance you get to join the blown finals club.

I bought the 897D and it truly is a rugged shack in a box. Want to work a little QRP dial down the wattage, need to bust a pileup crank it up. And the size of the controls and display are a lot easier on the eyes. Long term you'll probably be happier you spent your hard earned money on the 897 or at least the 857.

I chose the FT-897D, because it was the best thing going at the time. So far, it is still unmatched. It has its quirks and there are things which could have been done better. The same could be said about the FT-2000.

The fan comes on momentarily on all bands, which is a Very good thing and normal. A VHF/UHF radio is actually an HF radio that multiplies the HF base frequency yo VHF or UHF. Have you ever noticed how warm an HT gets? Same thing. Converting from HF to VHF/UHF makes a lot of heat.

That is not how the FT897 works, it does not transvert from HF to VHF.
In fact neither do most VHF/UHF radios. They generate directly at VHF/UHF.

My 897 is set to all the default settings, just like it came out of the box. I changed nothing at all and get good reports.

Yahoo group: FT897 (2010)
Date: 2010-05-06 11:45:10 UTC
From: pascalpete
Topic: 29933 Message: 29964

Greetings,

I am a relatively new ham (licensed October 2009). I carefully looked at lots of radios and asked many other experienced ham operators their thoughts as well.

I settled on the FT-897D for primarily two reasons:

1) I was new to the hobby and wanted one radio that would do it all (2 meter, HF, voice, ccw, digital modes, etc.). I did not want any limits while I explored what it was about ham radio that I really liked.

2) I wanted the ability to go into the field with the radio, be it for emergency comms or just for the heck of it. The battery/portable option was precisely what I was looking for.

I looked closely at the F817D but ultimately discarded that idea because of the QRP. As an Elmer pointed out, QRP can be fun but with the 897D you can always dial the radio back to 5 watts if you want. You can't go the other way with the 817D.

I love the radio. I personally don't see a need for anything different (for my uses), especially with my limited experience. It does everything I want, has the ability to expand to do portable work (when I save up the pennies for the batteries), and it does a great job. I get good reports with it. While it doesn't really matter much to me, the radio DOES look pretty cool as well. A bonus!

For me the radio choice was about figuring out what I wanted to do with it. That took me a longer time to figure out than I suspected. For me, the 897D was THE radio that fit everything I wanted to do.

Best of luck to you in choosing a radio.

From: David Okrent
Topic: 29953 Message: 29966

Thanks all that replied. Yes, I am aware of the difference between SSB and FM with regards carrier and side band operation, I was just surprised that a rig designed for 100 W or 50 W on 2 meters would require the fan on such a short transmission. I assumed heat dissipation would be better, I guess if you have a fan you don't have to design great heat sinks.

Thanks again.

First, how does this pertain to the 897? That IS what this forum is for.
Second, check the definition of "SPAM". It is something along the lines of
" un-solicited email or messages". Meaning that if you didn't ask for the
message or were nor engaged in a conversation with the sender prior to
getting it, it is SPAM.

Having it arrive in my inbox from this group makes it spam as it does not
pertain to the forum's topic.

Finally, check my bio on QRZ. I do enough to help with what time I have
available to do so.

DENNIS,

Would you please check the link and the organization before you pass
judgements? Just because I got it on twitter doesn't automatically make it
spam. Can't any charities/NGOs and other people wanting to help other
people be immune from ignorant premature judgement? Jeez!

"!?!?!?!" "!!!!!!!!!!"

73,
Frank

Hi Frank...

Dennis is right on this one.....I considered it spam as well. I know you are trying to do right, no one is faulting you on that one, but this is not the place to bulk solicit humanitarian support from hams.....Perhaps QRZ, EHam, or even the ARRL, would be better sites to post it on, and, more widely read.

hi
i would guess without looking at the schematic, that the keying
line, when in fm or am triggers fan automatically as a safeguard,-
mine does it even in a cold basement in winter at 5 watts- in ssb the
duty cycle is much less so they probably just let a thermal sensor do it
without looking, just my thought

All,

I agree that it is not directly related to the FT-897. But gentlemen -are you really all that busy that you don't have time to delete an email if you don't want to read it? It's one thing if it is some junk mail or potential virus carrier. But after all isn't the purpose of the FT-897 group to help us further a "hobby"? And isn't that hobby all about talking to others on the air?

There are a few of you on this group who never cease to amaze me. I can tell you one thing - if I ever hear you calling CQ, don't expect me to return the call. I'd be afraid you will have something negative to say to me.

ps: Note that I spent three years working for a non-profit humanitarian relief organization, at 60% of normal industry salary, because I believed in the work. That doesn't mean I'm entitled to shill for them (or anyone else) here.

29975. Re: [FT897] hams needed all over the world

Yahoo group: FT897 (2010)
Date: 2010-05-06 21:01:46 UTC
From: ZephyrNYC
Topic: 29960 Message: 29975

Dennis,

"First, how does this pertain to the 897?"

#1 All members of this group have an interest in the Yaesu FT-897.

#2 Every person who legally transmits on an 897 must have an amateur radio license.

#3 This organization is asking for assistance from licensed hams to assist distressed victims in various disaster areas around the world.

'Second, check the definition of "SPAM". It is something along the lines of " un-solicited email or messages".'

Below is the Random House dictionary's definition:

Spam [spam] <http://dictionary.reference.com/help/luna/Spell_pron_key.html>
Show IPA noun, verb, spammed, spam·ming.
1.
Trademark . a canned food product consisting esp. of porkformed into a solid block.
–noun
2.
(lowercase) a disruptive, esp. commercial message postedon a computer network or sent as e-mail.

*Origin: *
(def. 1) sp(iced) + (h)am; <http://dictionary.reference.com/browse/ham>
(other defs.) 1990–95; referring to acomedy routine on Monty Python's Flying Circus, Brit. TV series
Dictionary.com Unabridged
Based on the Random House Dictionary, © Random House, Inc. 2010.

#4 Last time I checked, I didn't attach any pork products to my original email.

#5 If you find my email disruptive, then it fits the definition. However, my email is NOT commercial in nature. I have no financial interest in the organization, which is a charity (non-profit) anyway. Is every single post to this group solicited by you? I don't know about you all, but I don't read or have an interest in every single post to the group. Do you know what I do with those uninteresting posts? I simply do not read, then I DELETE them.

But if you think it's spam, then it's spam. Would you like to know what I do when I receive spam? If it's not in the spam folder, I mark it as spam.

Would you like to know what I do next? I don't deride or otherwise attack the sender of the email. I DELETE it.

"Ham radio is a hobby, not a emergency service,
This list is not a twitter service.
dale "

#6 I never asked anyone to relay emergency communications or to respond to an emergency.

#7 I never stated that this group is "a twitter service", or sent tweets to this group as if it were my Twitter account.

No matter what you type, I am going to continue to help people who need it. If you want pix or updates from my future (or past) trips overseas or in CONUS, send me a personal email. Thanks for everything. I'm outta this group. Peace!

I have a very strong feeling that the opposite of love is not hate – it's apathy. It's not giving a damn.

Hi Sean,

I think you mean a 'diplexer'. Actually there is a good article in the current QST on the difference between a diplexer and a duplexer.

I'd say you can use either a separate run of coax and an antenna switch or a diplexer at the antenna.

I would think it's easier to try the diplexer first. But if you've got say 100 ft of 10 year old RG-58 you should consider getting better newer coax for 6m and using an antenna switch at your radio to choose the antenna.

73's,

Ron

A good quality coax switch will do the job. Quality is important, especially if being used a higher frequencies where loss becomes a problem with anything placed in the line (Including connectors) between the antenna and the rig.

Use brand names where insertion loss is given within the specifications for the switch.

You need a diplexer. This allows you to run the HF and 6 meter to the rig on one coax from the tower. Just read the article last month in QST explaining the difference between a diplexer and a duplexer. The duplexer is a big piece of equipment used on repeaters.

Sean,

You can use the LDG's switch, but this will require two full length antenna cables. If you use the diplexers as shown in the article, you could get by with much less coax as the two antennas would share a common feed line. If you don't mind running additional coax, do the math and determine which way is the most economical. Since the tuner already has an antenna switch, you won't have to buy another.

Fellow hams.
Has anyone solved their feedback problem or had one.
On my base station... I never operate mobile, on 160 and sometimes on 75 meters after a nice 1:1 swr load up... it goes exponential and shuts down. antenna is 400 plus foot loop with tuner at the antenna end not the transmitter. grounded even my bid toe and ferites every where.
Boy do i hate this solid state junk. Never ever had these problems with reliable tubes...
Not a mismatch at antenna. The turner is at the base of the antenna and station about 50 feet of coax.

From: Dan Schaaf
Topic: 29987 Message: 29987

Don't blame the solid state gear if you have a mismatch. The mismatch will be there even if you have a tube rig. The diference is that tubes will tolerate some mismatch before they burn out from reflected power repeatedly. But then, so will solid state gear, just sooner. Solve the mismatch problem first.

Sean

Your choice. Diplexers are great because you won't forget to change the switch. However, there is some loss through them 1-2db max.

You can actually run a diplexer at the FAR end and have the HF and 6M antenna connected to the diplexor on the outside. Saves coax costs and runs.

Mike VA3MW

Coax switches like the CS201 are cheaper.

Are you talking RFI?

Yep, tube radios/finals were much more forgiving for matching loads.

Have you tried the Radioworks
(http://www.radioworks.com/nbalun.html#RFIapplications) Line
Isolators. They have helped me many times.

The MFJ954 is great for measuring RF current problems.

What sort of tuner is at the antenna?

Looks good Mike -

However, there have been some problems the rotating contact finger, but all-in-all not bad.

My preference is the old Heathkit 5-position (HD-1234) switches...If you can find them. Relatively low insertion loss at VHF and UHF frequencies and rated at 2 KW.

Normal going price is $15-$20 (US). Been using them for over 30 years?

Sent: Thursday, May 06, 2010 9:01 PM
Subject: Re: [FT897] hams needed all over the world

Dennis,

"First, how does this pertain to the 897?"

#1 All members of this group have an interest in the Yaesu FT-897.

#2 Every person who legally transmits on an 897 must have an amateur radio license.

#3 This organization is asking for assistance from licensed hams to assist distressed victims in various disaster areas around the world.

'Second, check the definition of "SPAM". It is something along the lines of " un-solicited email or messages".'

Below is the Random House dictionary's definition:

Spam [spam]
<http://dictionary.reference.com/help/luna/Spell_pron_key.html>
Show IPA noun, verb, spammed, spam·ming.
1.
Trademark . a canned food product consisting esp. of porkformed into a solid block.
–noun
2.
(lowercase) a disruptive, esp. commercial message postedon a computer network or sent as e-mail.

*Origin: *
(def. 1) sp(iced) + (h)am; <http://dictionary.reference.com/browse/ham>
(other defs.) 1990–95; referring to acomedy routine on Monty Python's Flying Circus, Brit. TV series
Dictionary.com Unabridged
Based on the Random House Dictionary, © Random House, Inc. 2010.

#4 Last time I checked, I didn't attach any pork products to my original email.

#5 If you find my email disruptive, then it fits the definition. However, my email is NOT commercial in nature. I have no financial interest in the organization, which is a charity (non-profit) anyway. Is every single post to this group solicited by you? I don't know about you all, but I don't read or have an interest in every single post to the group. Do you know what I do with those uninteresting posts? I simply do not read, then I DELETE them.

But if you think it's spam, then it's spam. Would you like to know what I do when I receive spam? If it's not in the spam folder, I mark it as spam. Would you like to know what I do next? I don't deride or otherwise attack the sender of the email. I DELETE it.

"Ham radio is a hobby, not a emergency service,
This list is not a twitter service.
dale "

#6 I never asked anyone to relay emergency communications or to respond to an emergency.

#7 I never stated that this group is "a twitter service", or sent tweets to this group as if it were my Twitter account.

No matter what you type, I am going to continue to help people who need it. If you want pix or updates from my future (or past) trips overseas or in CONUS, send me a personal email. Thanks for everything. I'm outta this group. Peace!

I have a very strong feeling that the opposite of love is not hate – it's apathy. It's not giving a damn.

From: Alan E. Lutz
Topic: 29878 Message: 29998

Dan,

I am using the RT Systems USB -62 cable that was bundled with the their FT-897 control software as sold by Yaesu . For the cable to work with HRD , you will need to first install the RTS USB driver found at...

http :// www . rtsystemsinc .com/index. cfm

Click on "Install USB Drivers" on the left side of the display.

Next you will need to run an executable to search for the serial port that the USB driver will emulate. The instructions are found here...

http :// www . rtsystemsinc .com/ USBTester_template . cfm

Once the driver is installed and you find out its serial port number, start HRD and set it up using that serial port number.

I have had HRD occasionally lock up on me, requiring a re-boot, but I attribute it to the anti-virus that my ISP installed that has caused other computer issues since.

Good luck.

Assuming the RF is getting into your shack via the transmission line, you might try a 1:1 balun before the coax enters the shack. You can make one from several turns of coax pretty easily. Just Google coax balun.

30002. Newbe question about the 897D

Yahoo group: FT897 (2010)
Date: 2010-05-09 01:01:40 UTC
From: rickdwyer49
Topic: 30002 Message: 30002

I am new to amateur radio and like the idea that the 897D covers the HF bands as well as 6m, 2m, and 70cm.

Will the single ATAS-120A be good enough as the sole base station antenna to cover all those bands? The specs tell me that it will work but I wanted to hear from those that actually use this combination.

From: ai4wu
Topic: 29976 Message: 30003

I can't tell from the MFJ manual if it actually uses the data pins, but they do appear to be connected. That being the case, a Y cable may or may not work. The FT-897D also supports CAT connection via the microphone connector (menu 59), but you'll need to build or acquire a "splitter" or Y cable for that too. At one time, I built a breakout box using a CAT 5 cable and jack, but I don't use it anymore since I switched to the LDG AT-897 tuner that has an extra CAT port on it.

30004. ATAS-120A as primary antenna

Yahoo group: FT897 (2010)
Date: 2010-05-06 00:05:58 UTC
From: rickdwyer49
Topic: 30004 Message: 30004

I live in a deed restricted community and am considering the FT-897D with the ATAS-120A antenna for base use. I live in a deed restricted community and could install an antenna in the attic but the simpliciy of the ATAS-120A is very attractive. Do you think this would be a good choice of antennas as the only antenna? Would I also need the ATBK-100?

I just purchased an FT-897, SN 5N6600xx. I've determind it was manufactured in Dec 2005. My plan is to mount it in a Cargo trailer my Girlfriend (KE7DOG) and I are renovating into an ARES/CERT trailer. I have had the Freeband Mod done. Are there any suggestions as to what else I should do, or get for this unit?

Gary KE7MQF

P.S. The multiple menu system is something to get use to.

It's a good MOBILE antenna. But you can make it work better with ground
system. The same places that sell the antenna should also sell the radial
system that goes with it. You can prolly make something as efficient or
maybe even better on your own.

The ATAS 120 has the car's metal body to work off of.

Good luck.

Did you consider fighting the deed restriction? PRB-1 applies and your state may even have something similar. The ARRL can help, too. Check into it. You are a licensed ham and there are resources available to get you past deed restrictions. That way (if you plan on staying there a while) you can erect what antenna you want.

I am new to amateur radio and like the idea that the 897D covers the HF bands as well as 6m, 2m, and 70cm.

Will the single ATAS-120A be good enough as the sole base station antenna to cover all those bands? The specs tell me that it will work but I wanted to hear from those that actually use this combination.

A screwdriver antenna, whether manual or remotely driven mounted on a tripod with a ground system is a good hidden antenna. The ATAS 120 would be my LAST choice however. Remember the bigger the coil the more efficient the antenna will be. I use a MFJ 1664 on a tripod for portable use and it works real well. I use (6) 25 foot radials draped off of the tripod. I have worked into Europe and all around the US with this setup. If you want it remotely tuneable, check out the Alpine Antennas made by Wes. For the money you cannot beat this antenna. Get the one with the plexiglass cover, it is built like a tank. You can spend hundreds of dollars more and NOT get a better antenna!! Go to Alan's website, K0BG I think it is and read it thoroughly. Always remember, the larger the diameter of the coil and the length of the coil will normally give you a better system. Also, The longer the whip you use above the coil will also help. I would only use the ATAS 120 as a last resort with a home installation. Good luck with whatever you choose.

Folks,

Kindly halt this thread.

This forum is not the place to solicit for other groups, discuss or make political statements, etc. This includes adding text to your signature line/block. Yes, it is just fine to state in your signature block your association with ham related organizations (e.g., MARS, ARRL, etc.) but please don't use this as a way to solicit for other organizations. See #9 of FT897 Group Guidelines.

Also, please try to ignore posts like the one that started the subject thread by not posting replys (use your delete key). It only fans the flames. I typically address the problem with the original poster directly (off the list).

Tnx es 73 de Barry W4WB, Moderator

I've found no relief yet for legal contracts that we sign into. At this time a federal license offers no ham protection for antenna restrictions in personal purchasing agreements.

PRB-1 and the ARRL can help you when it comes to city or state ordinances against antennas but they can do nothing for deed restrictions or HOA rules. You sign into those (whether you realized it or not) when you purchased the property and it is a legal contract that you agree to. I know that in most US cities it is nearly impossible not to have these agreements and if you want to have a home for your family you may not have much choice but to buy into one of these.

However, all is not lost if you haven't signed the contract yet. My home's HOA strictly prohibits antennas but I drew up the plans for a reasonable antenna and submitted it to the builder/HOA BEFORE I signed the contract and told them that my purchase of the house was dependent upon their approval of my antenna. They approved it with no problems because they wanted to sell the house.

Of course there is always the fun challenge of "stealth" antennas. It's actually pretty easy to get a "stealth" antenna to work but not so easy to eliminate the interference on receive from all of the RF sources in your house when your antenna is close to it. Also due to the close proximity you are much more likely to cause interference. These antenna rules can actually have the opposite effect in regards to interference. Of course most interference comes from antennas that can be seen, whether they are transmitting or not. ;-)

For a stealth 2m/70cm, I built a dual band J-pole out of 300 ohm twin lead and put it inside a length of pvc pipe. I used white, but you could use black as well. I duct taped it to the chimney of a flat roofed duplex I was renting and no one noticed it. It survive two Virginia hurricanes and a Nor 'easter before I took it down to move. I've heard of other people using pvc pipe to enclose HF verticals and disguise it as a flag pole. The HOA couldn't accuse you of being un-patrotic, now could they?

You need a duplexer for the ATAS-120, however, the guy at HRO Denver advised against it. I use an Arrow dual band J-pole in the shack and a Comet CSB-790a dual band vertical on my truck AND my 50cc scooter as well. To use HF while on my scooter, I have to stop for safety sake. I'll have to make some ground radials to put on the ATAS when I have it on the tripod, otherwise I use G5RV wire antenna in the shack.

From: Noel Zeibari
Topic: 29976 Message: 30015

Dan K3ZXL, Chuck AI4WU,

Thank you both for the info. After digging for more solutions I came across the W4RT

Site, describing the CAT-MATE as a splitter for the data port of the FT-897.

Unfortunately, at the end of the description it states that the CAT-MATE is not

Compatible when using the ?Tuner? function of the radio.

I was wondering if I modify the Cat cable FT62 to plug into the Mic Jack

And leave the MFJ Tuner Interface Cable hooked up to the Data Jack.

Would there be any conflict?

73, Noel (OM) N3NZ

==========

Noel

Look at www.philcovington.com and find N8VBvCOM
It is a virtual port for one USB to 2 devices.

Dan Schaaf
K3ZXL
"In the Beginning there was Spark Gap"
www.k3zxl.com
==========
I can't tell from the MFJ manual if it actually uses the data pins, but they do appear to be connected. That being the case, a Y cable may or may not work. The FT-897D also supports CAT connection via the microphone connector (menu 59), but you'll need to build or acquire a "splitter" or Y cable for that too. At one time, I built a breakout box using a CAT 5 cable and jack, but I don't use it anymore since I switched to the LDG AT-897 tuner that has an extra CAT port on it.

From: Lucas
Topic: 30002 Message: 30016

Hang on, let's be careful. While I certainly wish it did, PRB-1, does not cover privately made agreements like CC&Rs. From the discussion about PRB-1 on the FCC website:

"...the Commission expressly decided not to extend its limited preemption policy to covenants, conditions and restrictions (CC&Rs) in deeds and in condominium by-laws."

Either way, that page is great reading, as the 1985 article especially includes some very useful arguments in favor of permitting antennas. Here's a link:

http://wireless.fcc.gov/services/index.htm?job=prb-1&id=amateur&page=3

Best of luck Rick.

On topic, I've read bad things about the ATAS-120 for base usage. I've been using wires in the attic instead, but it sure would be nice if someone could come up with a reasonably priced, restricted situation antenna. Something like the ATAS, that tunes directly from the rig, but with more consistent base station performance. Maybe get that MFJ loop to autotune using the FT897 tune feature.

30018. FCC announces possible changes to 5 MHz band

Yahoo group: FT897 (2010)
Date: 2010-05-10 16:20:06 UTC
From: steve_ve6vs
Topic: 30018 Message: 30018

As reported by the ARRL

http://www.arrl.org/news/fcc-proposes-additions-changes-to-amateur-5-mhz-allocation

Since the 897/857 have these 'channels' embedded what will be the procedure to reprogram the radios and is there an expectation that Yaesu will ensure new radios from the factory will have the new allocation, assuming it passes.

I am using a duplexer to feed two radios into a single tri-band antenna.

I am using a diplexer to feed a dual band radio into separate vhf/uhf beam antennas .

All depends on how you want to use them.

DE N7UVL,
Sounds like Duplexer & Diplexer are getting mixed up again.
Of course you would not use a Duplexer with a non-repeater./ga

I am using a duplexer to feed two radios into a single tri-band antenna.

I am using a diplexer to feed a dual band radio into separate vhf/uhf beam antennas .

All depends on how you want to use them.

DE N7UVL,
Again to be a bit more accurate: There are Pass Duplexers
& Notch Duplexers. Both have to be tuned. Which makes
them unsuitable for anything other than fixed frequencies.
A Band Pass filter will pass a "Band". A "Pass Duplexer" will
pass a narrow range of frequencies with a sharp enough
cutoff to allow non-interference of another frequency
nearby, such as the 600KHz off set of a Repeater.
-A Notch Duplexer is designed to notch out (filter out)
an individual frequency from interfering. Both are ment
for "same Band use".
-Diplexers can be used in "both" directions. "Band" Pass
to a radio or from a radio. And are ment for additional
Bands use.
-I suppose some one could have mislabeled a Diplexer as
a Duplexer. But Duplexers are called "cans" for a reason.
They look like a large can. and usually have one or more
tuning shafts at one end.
-Combiners use features of both Duplexers & Diplexers. A
main difference of combiners are they usually come as a
"bank" of combiners to run multiple systems to the same
antenna. But again, each one has to be tuned./ga

They are used for both.

For narrow spaced repeaters they are tune for one frequency.

One I have separates below 460 and above 840, says Duplexer on the case.

I have a 5 meg split 450 duplexer that has no name on it .

Repeaters are called duplex radio systems because they use two frequencies,

whether they use two antenna's or one antenna and a duplexer.

wrote:

>
> What reason did he give for not using a duplexer ?

Perhaps he ment a diplexor. Which is what I use with my ATAS 120. QST has
a nice article in the last issue explaining the difference between the two
devices. (Duplexors are used mainly for repeaters)

Please folks use a subject line indicative of the message. At some future
point someone may want/need to search for your message. And looking for
Newbe (or Noob or some other variation) wont be very helpful. If you feel
the need to drift off the subject line topic, you can alter the subject
line. But it would be better (for continuity to just start a new thread).
It makes sorting messages allot easier for most mail reader programs.

-x-x-x-x-x-x-x-x-x-x-[snip]x-x-x-x-x-x-x-x-x-x-x-x-x-

You need a duplexer for the ATAS-120, however, the guy at HRO Denver
advised against it.

Subject: [FT897] Newbe question about the 897D

I am new to amateur radio and like the idea that the 897D covers the HF
bands as well as 6m, 2m, and 70cm.

Will the single ATAS-120A be good enough as the sole base station antenna
to cover all those bands? The specs tell me that it will work but I wanted
to hear from those that actually use this combination.

That's what I meant, a Diplexer. I believe it had something to do with less wear and tear on the ATAS 120's motor if I were to use a separate antenna for VHF/UHF antenna. I've never plugged the ATAS into the VHF/UHF connector to see what the difference might be in range.

You need a duplexer for the ATAS-120, however, the guy at HRO Denver advised against it. I use an Arrow dual band J-pole in the shack and a Comet CSB-790a dual band vertical on my truck AND my 50cc scooter as well. To use HF while on my scooter, I have to stop for safety sake. I'll have to make some ground radials to put on the ATAS when I have it on the tripod, otherwise I use G5RV wire antenna in the shack.

From the ATAS 120 manual:

For operation on the 144 and 430 MHz bands, in addition to
HF/50 MHz, you may wish to consider the purchase of a
“Diplexer” (for the FT-897 and FT-100/-100D)

If you do not have a Diplexer or Triplexer, the coaxial cable connector
from the ATAS-120
will have to be moved manually to the appropriate antenna
jack when you wish to operate on VHF or UHF.

From the 897D manual:

On the 144 MHz and 430 MHz bands, the ATAS-100/-
120 does not require a tuning process. SWR will be satisfactory
when the antenna is fully retracted.

Exactly what we have to do in the UK where the 5MHz channels are not the same as the 897's per-programmed channles; that is do the wide band mod.

Actually, Jeff, there is a big difference in that one is designed to allow simultaneous transmission and reception in one band on the one antenna (Duplexer as it allows duplex operation), which is used in a repeater, the other allows the splitting of two bands onto one feeder (Diplexer) or three bands (Triplexer).

Well Eric, you had better tell all the manufacturers out there, because they use the term interchangeably.

Anyway what is the difference in allowing " simultaneous transmission and reception in one band" and "splitting of two bands onto one feeder"? Just your definition of what constitutes a 'band',(and perhaps the port to port isolation).

In the commercial world a device that allows simultaneous transmission and reception at VHF is still called a diplexer by a lot of manufacturers. The 'bands' are just 4MHz+ or so apart!!

For example Procomm call such a device a diplexer one place on the website and a duplexer in another. Spectrum Microwave just call them diplexers.

The reality is that no one really makes any distinction between the 2 terms.

The big difference between the duplexor and the diplexor is the size of the pocketbook needed to buy them. Duplexor less than $100 and the diplexor can be into the $1000's.

hi hi, even I got that turned around. The diplexor would be the cheaper one and the duplexor is the expensive one.

DE N7UVL,
At the risk of extending this thread further, there is a simple relatively non-technical definition for Diplexers & Duplexers:
-A diplexer is a passive device<http://en.wikipedia.org/wiki/Electronic_component> that implements frequency domain multiplexing<http://en.wikipedia.org/wiki/Multiplexing>. Two ports (e.g., L and H) are multiplexed onto a third port (e.g., S). The signals on ports L and H occupy disjoint frequency bands. Consequently, the signals on L and H can coexist on port S without interfering with each other.
-A duplexer is a device that allows bi-directional (duplex<http://en.wikipedia.org/wiki/Duplex_(telecommunications)>) communication over a single channel./ga

The reason they do not recommend a duplexer is it is better to use a separate antenna .

A separate dual band antenna works better , has gain and you do not have to tune it every time you change to it.>

Hi Noel,

I've had the same problem with my FC-40
As Chuck says, you can easily use the Mike connector which supports CAT .
Take a look here:
http://www.iz0inx.it/autocostruzione/MicCat.htm
There is also a donwloadable English version.

30040. Digital on USB or LSB

Yahoo group: FT897 (2010)
Date: 2010-05-12 00:40:00 UTC
From: kd8lam
Topic: 30040 Message: 30040

I have recently developed issues when transmitting digitally on USB or LSB. All that is heard on my end is a solid tone and the transmit light does show red. I have been able to transmit on USB or LSB in the past.

Interface: Signalink USB
Software: Digital Master 780
WinXP Pro

This happens using PSK, Olivia and MT63.

Any tips would be appreciated.

Mine did this when I had one of the CW options turned on - the one to allow
CW transmission in SSB or LSB mode. The radio seemed to think that the
keying signal from the signalink was a Morse key.

""I suppose some one could have mislabeled a Diplexer as""
""a Duplexer. But Duplexers are called "cans" for a reason.""
""They look like a large can. and usually have one or more""
""tuning shafts at one end.""

Hello Group

I've seen these "can" type devices on various repeaters here in the UK and they've always been referred to as cavity filters, (or just cavities to their friends).

If you look in the archives for early references to "my ATAS won't tune" etc you will find that at least one reason why SOME (and only SOME)diplexers (duplexers/splitters/radio signal matrimonial harmony devices)were not recommended is that. although they passed RF without issue the same circuitry would block DC voltage thus stopping the antenna motor from working. It seemed to be brand/model specific so hunt one out that has been proven to work and you should have no problem with it.

As for duplex, I believe somebody stated that a duplexer permitted two way traffic on a single channel? Is that possible without wires? Surely there has to be at least a miniscule amount of channel separation or you just end up with "hetrodyning"?

I was taught that simplex used "one chanel, way at a time". Split frenquency simplex (or semi-duplex) used "two chanels, one way at a time" and duplex used "two chanels, simultaniously in oposite directions". If this were on two very close frequencies then the receivers would need to have an extremely narrow front end filter.

Does that mean that a duplexer is basically an external addition of an extremely narrow front end filter? Or am I just missing the point altogether?

Regards

Kav

Hi Fil,

Downloaded the English version of your Mic/Cat project, seems easy enough to

Build.

Could not locate the 8 pin female mini din at Radio Shack or Micro center.

Ordered the parts from www.mouser.com, will be getting all parts within a week.

Best regards,

73, Noel (OM) N3NZ

Hello Kim. I am using an antenna tuner, but I am not using the ATAS-120. My HF antenna is a 19' dipole antenna inside my attic. For my tuner, I am using the LDG AT-897. I really love this tuner, it tunes everything I throw at it. From what I am told, it will tune anything under 10:1. The Yaesu tuner needs to be within 3:1.

DE N7UVL,
I seem to always leave something out. This time is the "why".
As Half/Full Duplex Repeater Frequency pairs are normally
programmed in to a Radio on "one channel" there is sometimes
a tendency to refer to that as a "channel".
-Simplex Repeaters only use one frequency. They "receive;
store: & forward"; all on one frequency, but not simultaneously./ga

However mobile phones are quite interesting. They use a range of frequencies, but the digital encoding allows time compression and transmitting on a part duty cycle. You could convievably achieve full duplex operation on a single frequency with each participant using time slots - time division multiplexing. I don't think the 897 could do it particularly well as it couldn't switch between RX and TX fast enough - or you'd have to use quite long time slots so introduce a notable delay in the speech, and I suspect you'd end up replacing the transmit relay a bit sooner than expected.

Hi, Hank, great to know this which proves again the reputation of AT-897, I also heard about its design being able to fit right on sidepanel of FT-897 and replication of the outlet for connecting to CAT cables..Thanks and 73s KIM/BM2JAM, Shanghai, China

To answer your question... A duplexer, as used in a typical ham radio repeater, allows a transmitter and a receiver to operate on one antenna, one one band (eg: 2 meters)... *not one frequency*.

A duplexer isn't typically needed for operating on 2 different bands as in cross band repeater mode.

Yes you are correct, 2 RF sources transmitting on one frequency simultaneously does not work out, it causes hetrodynes (AM) or capture (FM).

Thsi si the propblem when people look things up on the web and believe without question!! (particularly Wikki).

A normal amatuer repaeter operates in 2 frequency simplex mode, not duplex.

However, you can indeed have tx and rx on the same frequency simultaneously. There are several system that achieve this, try Googling 'on channel repeater'.

One noteable system was the Plessey Groundsat that even managed it from a manpack radio with out any filtering and huge antenna isolation.

Regards
Jeff

30058. ACC Jack

Yahoo group: FT897 (2010)

From: PY5VB-Villas Boas
Topic: 30002 Message: 30058

Hi All:

In operator manual, page 18 (897D rear conectors) , has a description
about ACC Jack (item 5)

5- ACC Jack
This 3.5-mm 3-pin jack accepts external ALC (Automatic
Level Control) voltage from a linear amplifier on the tip
connection, and accepts a "Transmit Request" command
on the ring connection. The main shaft is the ground re-
turn.
The "TX Request" connection, when shorted to ground,
puts the FT-897D into the transmit mode, and sends out
a steady CW carrier, for linear amplifier or manual an-
tenna tuner adjustment.

I put a 3.5mm 3 pin in this jack and I shorted ring to ground like upper
description BUT do nothing
Is a fault or any configuration ?

Tnx for help.

I use this jack with my LDG AT-100 Pro II tuner and it functions as expected. I do not recall having to make any menu changes to set it up. When the tuner is "tuning up" the transmitter drops back to 25 watts (if it is set higher) and keys up in CW mode. At the end of the tuning cycle it jumps up to the set power (I usually have it at 100 watts) just before cycling the transmitter off.

Hi Villas,

It works on mine and I'm not aware of any configuration setting that needs to be set. Make sure that you are using a common ground with you rig. It sounds like you may have a fault.

I built a small box that has a button on it that I push to tune my autotuner. When I push the button it applies a ground to the "TX Request" line and a small negative bias voltage to the ALC line. I have the bias adjusted so that the rig transmits at about 10 to 20 Watts when doing this. The nice thing is that it will transmit a carrier in any mode (it's zero beat on SSB) and there is no sidetone. Whenever I change bands I just push the button for about half a second and my antenna is ready to go without activating the SWR protection circuit or stressing out the finals. (NOTE: the external ALC voltage needs to be disabled when the button is not pushed or it will mess up your SSB response. I just use a DPDT switch for the button)

From: Grant Hopper
Topic: 30062 Message: 30062

Discussion of the FT-897 & FT-897DWhile I haven't done an exhaustive search of the internet to figure out the difference between my LDG AT-897 and the 'plus' (and I'm not sure I should have to - shouldn't something like that be on the LDG site?), I've searched LDG's site and this forum as well as a general google of the topic and amazingly enough, I still can't establish what the differences are between the two.

I'm hoping someone here can point me to a reference or resource, or failing that, explain what changed in the 'plus' model.

Thanks and 73,

Grant

Looks like one difference is the "plus" has 2000 memories and "non-plus" has 200. I got this from the online manual on LDG's web site.

From: JonP
Topic: 30043 Message: 30064

I have the AT-897. It is "okay" as an antenna tuner, but not great. So far I have found that it will tune into pretty much anything, but just because it tunes does NOT mean that you'll actually get a signal out.

For example, I have a multi-band dipole. Down at the lower end of the 10 meter band (say around 28.4MHz), the AT-897 will give a solution, but nobody can hear me when I transmit. I ran some tests with friends and 10 miles away from my station (6km), they cannot hear me when I transmit at 100 watts (sideband) after tuning even though they can hear me if I transmit at 5 watts before tuning. I've been able to duplicate those results with two other AT-897s and three different FT-897s.

By the way, using infrared film, I was able to determine that the AT-897 gets very very hot in that situation -- in other words all the power is being lost in the AT-897.

While vendors would like us to believe that rig-specific automatic tuners like the AT-897 can handle as much as a 10:1 mismatch, they really cannot handle much more than a 3:1 mismatch. They'll give a solution out to 10:1, but that solution will result in most of your power dissipating inside the tuner.

Given what you're planning to use as an antenna, your best bet would be a good MANUAL external tuner like the MFJ Versatuner line. I have a Versatuner II. Using that same antenna with the Versatuner, I have no problem getting a signal out that people can hear. I've also used it to tune up a 40 meter output on a 2 meter vertical, to tune up against a rain gutter and other ridiculous things that we test for emergency communications purposes.

Remember also that just because a tuner at the transmitter is making the transmitter happy does NOT mean that the antenna is happy. If you are using 50 ohm feedline to an antenna with a 400 or 600 ohm impedance, you will wind up losing a lot of your signal to heat. A manual tuner will tell you the actual impedance of the antenna system. You can then insert a balun (or unun) where the feedline meets the antenna and dramatically improve the strength of your output signal.

Date: 2010-05-15 14:17:33 UTC
From: Mike Ernst
Topic: 30062 Message: 30065

I have an AT-897. It is my understanding that one difference is the AT-897 tunes wherever you have the power setting (so if you are at 100W in FT-897D menu the tuner will tune at 100W) - but the AT-897 Plus reduces power by its internal circuitry prior to tuning. The advantage of this is that if there is RF present - which can happen if you forget to first lower the power and try to tune a high SWR antenna while at high power - the AT-897 will not find a good solution. But with the AT-897 Plus it will first lower the power and then will likely find a solution.

Please note, there are some add on modifications to be found on the internet (both for purchase and for home brew) to make the AT-897 lower the power before tuning as well.

> frequencies, but the digital encoding allows time compression and
> transmitting on a part duty cycle. > >

This is probably very true (sms was just emerging when I last researched mobile technology) but I thought those attributes served only to make the transmitter small and the audio content moderately secure.

The thing that gives cell phones there simultanious two-way ability is the seperate tx and rx frequencies with 45Mhz of seperation. You could drive a double decker amateur band through that gap. You can also leave the RX permanently open as the TX freq is so far removed as to be totally outwith the scope of the receiver, hence duplex.

> > Does something here remind you of a mobile [cell] phone
> >

I guess I missed the point here as well. Which bit reminds you of a cell phone?

Hi Rudi,

Mine has done that at times too. From all indications the IPO is not really functioning on VHF but some kind of glitch causes the IPO indicator to stay on. I'm not sure how I got rid of it but I think it went away when I reloaded the memories from the computer. A reset may get rid of it too.

From: thb201
Topic: 30062 Message: 30069

The Plus model is a true one touch tune system. You press the "Tune" button, the tuner then instructs the radio to reduce power and also change mode to AM (constant carrier). The tuner then "tunes" and after finding a solution will return the rig to whatever the previous mode was and to the previous power output setting. The Plus also has more memories and an extra CAT connector. To me it seems to be just a little bit better built than the previous model, but that's just my impression. This is a vast improvement over the previous model. I do not own the older model but a friend does so we we were able to compare. He's now sorry he didn't wait to buy the newer model as it is so much easier to use. The Plus model works well and is worth the money as far as I'm concerned.

I should point out that these LDG tuners are not "true" autotuners. A true autotuner will sense a change in SWR if you tune around the band or change frequencies, and then automatically retune without any interaction from the operator. SGC tuners are true autotuners. With the LDG you still have to monitor SWR yourself to see if it goes too high and then press the "Tune" button to retune. This is possibly drawback in that the LDG tuner does not have an SWR indicator (LED indicator) like other LDG tuners so you must be able to read SWR either using the internal display in the FT-897 or by some other means such as the external LDG FT meter or some other SWR meter.

Hope this helps.

From: RicardoH
Topic: 30043 Message: 30070

Hi Kim,

I use a vertical multi-band antenna and considered the ATAS-120 while looking. I was cautioned that though the ATAS-120 is a fine antenna it is very sensitive to how ground is presented to it. Yaesu offers a radial kit to go with the ATAS. Be sure you can use the antenna effectively before you buy.

30071. S-meter sensitivity problem

Yahoo group: FT897 (2010)
Date: 2010-05-17 05:21:24 UTC
From: yo5orw
Topic: 30071 Message: 30071

Hello.
I had some problems few months ago with the noise on all bands (with or without the antennas). I sent the rig back to Yaesu and the problem was solved. They told me that there were some wrong setups and realigned the rig. Since it's back I have problems with the S-meter bar. Even if the signal is very strong (I can hear the speaker very clear and loud without noises and the squelch is far over the noise limit), the S-meter shows nothing. In case of a station close to the rig, when the signal is S10+, the S-meter works.
Is there any hidden option which sets the S-meter sensitivity? Does anyone had this problem?
Thanks in advance.

From: bigbob19722000
Topic: 30076 Message: 30076

Ok, here is the issued:

I have 40 meter Dipole up in a tree about 50 feet inverted Vee. The dipole's coax coming into the shack is about 100 feet away.

In the shack I have a W2IHY(8 band eq) connected with a heil heritage mic to the FT 897 connected to a Tokyo-hy power (via the ARB 704). I also have a MFJ tuner III connected.

The problem arises when I turn the Amp on with the mic connected.
The radio shuts off and turns back on when I try to transmit. On Ten meters there is no problem.

When I connect the original mic and repeat the above situation on 40 meter, I dont have a the problem of the radio turning off.

I would like to get this problem resolved and get this system up and working on the band I like to ragchew on.

Thanks for the help.

30077. Re: [FT897] LDG AT-897 versus the 'plus'

Yahoo group: FT897 (2010)
Date: 2010-05-15 03:15:21 UTC
From: Patrick
Topic: 30062 Message: 30077

My manual that was supplied with my LDG AT-897 Plus, states the following.

The AT-897 Plus is similar to the previous LDG tuners, but is specially engineered to integrate with your Yaesu Ft-897 HF Radio. The AT-897 Plus connects to the CAT(Computer Automated Transceiver) port on the back of the 897. The CAT interface allows an external device such as a PC or the AT 897 Plus to control the the 897 by sending it serial commands. The 897 Plus takes advantage of this interface to simplify the tuning process -- one button push is all that is needed in order to switch the radio to AM mode, reduce output power, transmit a carrier, measure the transmit frequency, and then store to it's previous mode and power level!

Or did you try emailing LDG, and asking them?

Jumping in a little late, but for what it's worth, I use the LDG AT-100 Pro II tuner. It's compact, uses little power, has LED "meters" and only uses the ACC jack on the FT-897. I also have HRD connected via the CAT port on the FT-897. In addition to the above features, I chose the tuner because it would provide me portability I need as well as being a nice unit in the shack.

Lou,
The Mic input for the 897D can also work as a CAT input and you could be getting RF into the connector or something strange like that. Check you menu for mic setup and make sure it isn't in 'remote' mode and that may solve your problem.

It would be legal to transmit on 11 meters as long as you keep your power limited to 5 watts. Using more power might be tempting, but is not advised. Case in point, a pair of illegal CB'ers were using illegal power and had a harmonic interfere with the VHF ground aproach frequency at Denver International Airport (DIA).

Actually it depends on the user's jurisdiction. In the USA, it is absolutely not legal to use a modified radio to transmit on 11m. The FCC's FAQ at
http://wireless.fcc.gov/services/index.htm?job=service_home&id=cb

spells that out pretty clearly. The radio must be an "unmodified FCC certified CB unit."

Joe,

You could configure your microphone jack to be used as a CAT port: however this defeats the use of the RJ-45 as a mic jack. Same as with using the CAT/LIN/TUN DIN jack in the back of the rig. If using the FC-30 tuner you must designate that DIN jack as either a tuner port or a CAT port in the menus. Although there is a device out there that will allow you the capability to plug in 2 DIN - capable devices into the single CAT/LIN/TUN DIN jack in your configuration simultaneous operation of both CAT & TUN is impossible through the DIN.

Regards,

Mark (NM7L)

I 'believe' only FCC type accepted radios can be used on 11 meters. As CB'ers do not have to learn any electronics to obtain a license, the Feds do not trust them to build a CB radio that is 'clean'.

So..no, you cannot build your own radio..has nothing to do with amateur radio and self regulation.

You can't build and transmit on 11m (or any other non HAM band) in the US.
Build anything you want for the HAM bands and as long as it meets the regs
on spectral purity and power output you are fine.

(If you want to build a rig for 11m, you can as long as you put it through
the FCC certification process - not a cheap thing)

Jose:

I think the point is that in the US 11 meters is not a ham band and operations fall under other rules that don't permit custom built or modified equipment. If you're on the 11 meter band, you're operating outside of any Ham "regulate each other" thing. I personally can appreciate that many Hams have the ability to build, modify, and operate so as to be compatible with other operations on 11 meters, but the reality is that it's not permitted for us to do so on that band. If it were up to me, I'd eliminate CB alltogether (which is easier now that it's seeing less use) and give the spectrum to Hams with an expanded power limit of 10 KW and data bandwidth to 50 KHz. But I don't make those decisions, so it is what it is.

In the UK a CB radio must be type approved. I'm not sure about the antenna, though there are limitations on the type and size antenna you use which effectively limit it to a loaded vertical against a ground plane. We have some of our local hams who occasionally play CB, but they use type approved kit to do so.

A nice thing about amateur radio is you have a lot more freedom to experiment both with antennas, and once you have the intermediate licence in the UK you can experiment with radios.

It would be technically illegal in the UK for an M3 or M6 licensee to operate a modified radio, even on the amateur frequencies. You can only used a type approved radio or type approved kit built as instructed.

All-
About every month or two, someone mentions 11m and "opening up" the FT-897 for whatever reason. At that point, a long discussion ensues regarding legal or not, build from scratch or modify, US or other country, etc. on and on ad nauseum. Do we really have to go through this again?? I hope not!

As annoying as it may be to the long time readers here, there are enough new readers monthly, that have NOT had the pleasure (sic) of the repeated musing on the 11m topic(s), so...in answer to your question Carl, YES, we really DO have to go through it again....and again.....and again.......

Sorry OM....

Joe,

I do not know, and really have no interest on 11 metres.
Didn't even know you needed a license to operate a CB radio.
I just have a problem with "regulations" I guess.
I believe in self regulation, as we have in the ham world.

I 'believe' only FCC type accepted radios can be used on 11 meters. As
CB'ers do not have to learn any electronics to obtain a license, the Feds do
not trust them to build a CB radio that is 'clean'.

So..no, you cannot build your own radio..has nothing to do with amateur
radio and self regulation.

I believe that Part 95 of the FCC Rules and Regulations covers Class D Citizens Band (11 meters).

Joe is correct relative to the "Type Accepted" equipment. Presently there is no license requirement to operate on 11m CB, although licensing was required up until (I believe) the mid-1970's. Some believe that the FCC gave up trying to regulate the band.

I'm sure that there are any number of books and/or articles dealing with the "hay-day" of CB.

Joe-
No, one doesn't have to go through it over and over- It's all in the archives, several times. Why bother those who are not interested? If someone is interested in 11m topics, then kindly refer them to the appropriate messages in the archives. That seems reasonable to me. I'm not saying "Don't tell the newcomers", I'm saying just don't do it here.

According to what you say then, since most of the questions that are asked are repeated questions, then the reply should then just be "check the archives, the answer is in there".

OK gang...I am not the moderator here, but..I can see this is getting circular. Let's drop it before the mod steps in and sends us all to the corner. Everyone has expressed their views..on to more important things!

Like...

Who is using what radio for field day this year? The FT-897? The FT-857? Or another model radio? (I know a fair number of the FT-817's are gonna be used.

What is your preference and why? What antenna (system) are you going to use? Why?

In the US if you modify a Radio Amateur equipment (Radio) to be used for the 11 meter band, you might loose your radio amateur license.

Actually it depends on the user's jurisdiction. In the USA, it is absolutely
not legal to use a modified radio to transmit on 11m. The FCC's FAQ
at
http://wireless.fcc.gov/services/index.htm?job=service_home&id=cb

spells that out pretty clearly. The radio must be an "unmodified FCC certified
CB unit."

It is againstyour licensing conditions to use amateur radio equipment to transmit on the CB band, and as a licenced amateur you could lose your licence by using amateur radio equipment to transmit on the CB band.You can only use type approved CB radio transceivers which the 897 is not, and if modified so it can/will tx on that band it is not filtered/suppressed etc for 11mtrs it then can/will throw out sproggies etc plus be over the approved pwr limit for the CB band. If you wish to use the CB band why not just buy a type approved radio.

From: Alex Schwarz
Topic: 5358 Message: 30108

Hi KC2SOU;

The filters that you are looking for are very expensive.

Can I suggest a alternative. I am the moderator of the MDSRadio Yahoo group and we have been developing a demodulation and DSP software (runs on a Windows PC) with hardware system that takes the 455kHz IF from the option port and converts it down to 12kHz which plugs into the soundcard. From there all the demodulation and the filtering is done in software. The down converter works for DRM as well. The resulting audio is astoundingly clean!
The whole project is a non profit development developed by amateur radio operators. We also have a kit available for cost and we ship worldwide.

Please check out the website: http://users.skynet.be/myspace/mdsr

All the best;

Alex

I uploaded a file with the condensed version of this 11 meter discussion

Anyone can download the file, add another FAQ, and upload the updated file.

That way no one person has to carry the weight.

In order to make finding it easier, is there some way the FAQ file could be the first file in the "File" section?

Steve:
Have a litle jumper "J27" near TXCO unit in FT-897D and I put it in "REQ" position (TXG is other position for this jumper) and now my ACC Jack is OK.
I put a old keyer in ACC Jack and whem I put it down my 897D put carrier for my IC-AT500 auto antenna tuner. Very nice.

Tnx and 73.

Folks,

Kindly halt this thread. Modifying the FT-897 to operate on bands outside of the amateur bands is not appropriate (CAP and MARS are exceptions). To be clear, it doesn't matter if your country allows such modifications, this modification isn't an acceptable topic for this forum.

Sounds like you are getting RF back through your mic. If someone else doesn't come up with solution, I will do a little research see what needs to be done. You may have to contact Heil for fix.

Subject: [FT897] I need help in trouble shooting my set up

Ok, here is the issued:

I have 40 meter Dipole up in a tree about 50 feet inverted Vee. The dipole's coax coming into the shack is about 100 feet away.

In the shack I have a W2IHY(8 band eq) connected with a heil heritage mic to the FT 897 connected to a Tokyo-hy power (via the ARB 704). I also have a MFJ tuner III connected.

The problem arises when I turn the Amp on with the mic connected.
The radio shuts off and turns back on when I try to transmit. On Ten meters there is no problem.

When I connect the original mic and repeat the above situation on 40 meter, I dont have a the problem of the radio turning off.

I would like to get this problem resolved and get this system up and working on the band I like to ragchew on.

Thanks for the help.

Hi,

I think that you will find that it will become a much hotter topic when the US FCC 5MHz channel change proposal goes through.

Then US operators will also have to do the wide-band mod, as much of the rest of the world who have 5MHz channels already have to do, as the channel will not be one of the pre-programmed ones.

There's a UK experiment at 5MHz at the moment. You need a Notice of Variation on your licence to take part. A friend asked me if I wanted to join him in testing it. We live about 40 or 50 miles apart so quite good for NVIS tests. I'd have to use a magnetic loop or similar in my current location, so see how well such a thing could work for NVIS.

It would be easy to modify the 897 to do this but would need some care to ensure it still performs properly, and also that it does not damage the radio. I'd expect to keep to low power, but I do anyway. The alternative would be to make a radio or modify a kit radio I have which is also an interesting possibility.

fortunately 1 of the channels for 60m is shared with the US, but only one of the 5 we have here.

I want to use two different antennas off the HF/6 meter antenna output. I currently use a coax switch which is sort of a pain. One goes to my Dentron MLA-2500 for HF and the other goes directly to my main antenna switch. This just ads another coax switch to the whole mess.

Is there a diplexer or duplexer that will work with the 897D that will eliminate the coax switch?

Comet makes Diplxers.
A Duplexer is for same band operation. Such as for repeaters.
Read this months QST and you will see the difference.

IF you want a signal to go to a single antenna at any one time. I'm afraid
you're still going to need a switch.

IF you're wanting to connect two output's from the back of your radio,
investigate a diplexor.

Comet makes a range of diplexers and triplexers. I use one with my 897 to split HF and 6M. They will work either way around, too so you can use two antennae with the one radio or you can use 2 different band radios with the one multiband antenna.

The Diamond MX610 will work to split one transceiver to 2 antennas. The low side covers 1.6 to 20MHz and the high side 49 to 470MHz.

30127. Comparing the 897D with the FT-950

Yahoo group: FT897 (2010)
Date: 2010-05-21 14:36:56 UTC
From: willgord
Topic: 30127 Message: 30127

I operate the 897D under less than ideal conditions. Living in a New York City apartment, I must use a screwdriver antenna inside the apartment with a counterpoise hanging out the window.

Even so, I have logged 75 countries and 46 states. In other words, as imperfect the set-up is, it has worked better than I had expected.

Now I have the bug to upgrade my radio to something better. I had narrowed my choice to a Yaesu FT-950 and an Icom 7000--with the nod going to the 950.

Has anyone compared the 897 with the 950? Any thoughts on one vs. the other would be appreciated. I am looking for a rig with less noise than the 897D and with a more advanced, sophisticated set of filters and more advanced DSP.

I would keep the 897D to use on VHF-UHF. I am intrigued, for instance, by 2 meter SSB. What I am hoping for, with the 950 (or the Icom 7000) would be a quieter radio, with somewhat better selectivity and an improved ability to pull weak stations out of the noise.

I operate phone on 15, 17 and 20 meters--have dabbled with 10 and 40 meters. Also work PSK31, primarily on 20.

So,any thoughts would be appreciated. Lest you think I am deserting my 897D colleagues, I think it is one of the most amazing radios ever made.

From: Dan Schaaf
Topic: 30127 Message: 30128

The 950 has IF DSP. The 897 has AF DSP. As a result, in the 897, you get AGC pumping with strong nearby signals. This is reason enough to buy a 950.
With IF DSP, you can eliminate the nearby QRM in the IF stage before it gets to the AGC circuit.

I use the 920 and it has AF DSP, drives me nuts !!! I also have the 897D. I use the 897D on VHF where you normally do not get too much nearby strong signals. Of course when F2 propagation begins on 6 meters in a few years, that will change on 6 meters.

I use the 897D on 2 meter SSB and CW and it works great.

Once again, in PSK mode, you cannot tolerate nearby strong signals with AF DSP.

The narrow CW filters combined with IF shift go some way to mitigating this,
but cannot go as far as IF DSP.
ICom still have the upper hand with their twin pasdband idea - simple but
effective.

My 2 cents worth. I have a 897D and the new IC-7200. For the money the 7200 is a far better value then the 7000. You have digital TBF, NB, NR, (3) usere adjustable filters for each mod, band stacking, direct freq input, and a usb port on the back for digital....no interface needed. Small foot print, water/mosture resistant, and a whole lot more. Built like a tank and built to last. If you can live without 6 m FM this is the radio of choice. The 7000 is a great radio but with heating problems and has the same 32 bit dsp + 24 ADC as the 7200 and PRO series/7600 and up.

OR you can just turn the RF Gain back and the AF Gain up, the AGC won't pump and your waterfalls will look better. That's what the RF Gain is for.

I agree that IF DSP before the detector is better given a choice.

Steve

Not necessarily true.

If the signal that you are trying to detect is weak or weaker than the adjacent QRM, then the problem still exists and in weak signals, they can fall off the spectragram (or waterfall if that is what you use) and then the soundcard will not detect it, if you reduce the RF gain. The AF gain has NO effect on the digital port. Only the PC Sound card gain control has an effect. But if the signal ain't there due to adjacent qrm pumping the AGC, then you can't detect the signal of interest.
I have experienced this countless times. Some fool turns on PSK right next to the DX RTTY or PSK signal which is halfway around the world and I lose the DX due to the AGC.

From: brycerichard
Topic: 30103 Message: 30133

Why?
Because they are the radios we own

Our group will be almost 100% Yaesu
FT-897D (2) because they have both SSB and CW filters
FT-857D (2)
FT-100D (1) with filters as backup or checking bands
FT-8900 (1) for the UHF/VHF GOTA radio
K-3 (1) for digital (PSK31 & RTTY) because of the filters

We will be operating as K6TI (because it is short)

We will be adding 2 ICE bandpass filters this year

This will be our 3rd year and we learn as we go.

73,
Bryce
K6TI

The AF gain has NO effect on the digital port. Only the PC Sound card gain control has an effect. But if the signal ain't there due to adjacent qrm pumping the AGC, then you can't detect the signal of interest.
> I have experienced this countless times. Some fool turns on PSK right next to the DX RTTY or PSK signal which is halfway around the world and I lose the DX due to the AGC.
>

An IF DSP may well still suffer under these conditions. The A/D has a finite dynamic range, just like an analogue IF, so if your adjacent signal exceeds the dynamic range of the IF DSP input then you either overload with lots of distortion products or you still have to apply AGC before the DSP!!

In reality the best solution is a very steep sided IF filter of the required bandwidth and a very high dynamic range IF of what ever type. However, it will still be nearly impossible to resolve a very weak signal close to a very strong one unless the dynamic range of the IF is greater than the level of the storng signal that leaks into the IF pass band. If that requirement is not met then AGC (or RF gain reduction) will still have to be applied before the IF stages.

Sorry to resurrect an old thread, but ...

When I look at the W4RT site, he says:

"Improve your CW and PSK operating experience with the 300 Hz or 500-Hz CW filter ... to perform nicely in the CW and PSK modes.

Since PSK is essentially an SSB mode, it would seem to me that it means that there must be some way to invoke the CW filter for sideband. How is that done? Or does the rig automatically use the CW filter when operating in the Digital mode?

Whichever mode you're in you select the filter manually using the function buttons. In CW mode the wider filters allow you to search around for that signal before closing in on it. Similarly other narrow modes such as PSK31. Once you've found what you want to listen to you can engage the narrow filter.

It's quite nice in PSK with the waterfall display because you can see the effect of the filter and also the IF Shift function if you use it.

The Amateur's Creed

The Radio Amateur is:

Considerate...never knowingly uses the air in such a way

to lessen the pleasure of others.

Loyal...offers loyalty, encouragement and support to their

fellow radio amateurs, their local radio club, and to the

American Radio Relay League, through which Amateur

Radio is represented.

Progressive...with knowledge abreast of science. It is

well-built and efficient. Operating practice is above reproach.

Friendly...slow and patient sending when requested,

friendly advice and counsel to the beginner, kindly assistance,

cooperation and consideration for the interests

of others. These are marks of the amateur spirit.

Balanced...radio is their hobby. They never allow it to interfere

with any of the duties they owe to their home,

job, church, school, or community.

Patriotic...their knowledge and their station are always

ready for the service of his country and their community/

Who wrote the Amateur's Creed?

The Amateur Creed was composed in 1928 by Paul M. Segal -

then 9EEA in Denver, and General Counsel of the ARRL. The

creed has been updated a few times over the intervening

years, to update the text and put it into contemporary terms.

The Amateur's Creed appears in a number of ARRL publications

such as the Handbook, and is just as valid today as it has

been for nearly 70 years.

The American Radio Relay League has turnerd into a NGO and a very political one at that.
I can and will never be loyal to the ARRL and ignore all their requests for funding.
I am, however very active in my local Ham Club.

As this is not a political group and we should be discussing the FR897, I don't think we need to go there,
besides there are a lot of non Americans on this group to thankfully this does not apply.

Really good to remind folks about what the hobby is about. I get put out trying to pick up a few DX stations with the inconsiderate operators that start calling before the station comes back with a QRZ. These are often the big gun stations and bragging about their 1000 or 1500 watts and an 80' tower.

I'll put my soap box away now.

30148. New version of FT897D

Yahoo group: FT897 (2010)
Date: 2010-05-23 20:01:39 UTC
From: Jirka MWW
Topic: 30148 Message: 30148

Halo hams,

my FT897D has a serial number starting with 7K (September 2007) and I am
not able to find the right service manual for it.
All which I have found on the web is dated 2005. The main difference, which
I have found up to now is that my 897 is equipped on VHF/UHF PA
with the FET RD70HVF1 instead of original bipolar transistor 2SC3162. Do
You have any idea , where to find a service manual for this model ?

Many thanks and 73!

Jirka OK1MWW

Danny,
even though I have ferrites and ground straps in my case even with a tuner at the antenna input outside of the house.. for the past 7 yrs I ahve been unable to operate on 160 and most of 80 with a 360 foot loop... never had this problem with my 40 yr old tube. Unit. So.... not a new problem. In my case I do not need to turn on an AMP. It does it on low power even...
Hope you solve it .... I have given up.

It is an SGC tuner right at the antenna input... so the cable is 1:1 all the way to the transmitter. No big SWR problems at all. Also it happens when running low power. I do not use a linear. My junk Galaxy V never gave me any problems running even a linear with less than good SWR. This is not an SWR problem. It is a Yaesu piece of !@##$!@$ problem. I have chokes and ferrites all over the place.

From: rschaffrath
Topic: 30148 Message: 30152

I gather the 2005 version you are referring to is the one labeled FT-897/FT-897D. I have that one as well and have not heard of any updates. I had found a website that documented the changeover to the superior RD70HVF1 but no further details. I bookmarked it on another computer. I have a FT-897D from 2006 and have been meaning to check which transistor I have.

I talked with someone when I lived in Virginia Beach that used an FT - 817 with a handheld dual band beam antenna from his hotel room on 5 watts. I think he told me that he had to just listen and manually tune as the satellite passed. I'm not sure how to do it. I think it's covered in the manual under odd splits.

In my manual (English, 2007) the satellite operation is described in
details at the page 68. In case of interest,
I can make a scan and upload to the web.

Hi All,
I think what you are seeing with the new finals is that the old final transistors are no longer available and there is a different biasing required for the new transistors.

If this is a 1-1 parts replace, then the signal processing flow of the block diagram should be the same.

In that case, Yeasu would not likely bother issuing any updates to the manuals.

Why should they spend money if the changes are minor.

The service manuals on the Internet are obsolete and incomplete,
presumably from the time the product was introduced on the market.
Current manuals can be purchased for a nominal fee (UKP 10 plus
shipping) from Yaesu. For that kind of money I just buy the real thing
and let Yaesu know I appreciate them making these manuals for me.
I have RevC docs.

The switch from transistor to FET was made starting lot 69,
according to their docs.

There have been numerous changes in the design throughout the years.
Details are in the docs

could it be RF getting to your power supply via dc leads or mains and shutting down? just a thought as it would look like a radio issue.

It is an SGC tuner right at the antenna input... so the cable is 1:1 all the way to the transmitter. No big SWR problems at all. Also it happens when running low power. I do not use a linear. My junk Galaxy V never gave me any problems running even a linear with less than good SWR. This is not an SWR problem. It is a Yaesu piece of !@##$!@$ problem. I have chokes and ferrites all over the place.

30164. Re: [FT897] Comparing the 897D with the FT-950

Yahoo group: FT897 (2010)
Date: 2010-05-21 14:49:56 UTC
From: Dan Schaaf
Topic: 30127 Message: 30164

The 950 has IF DSP. The 897 has AF DSP. As a result, in the 897, you get AGC pumping with strong nearby signals. This is reason enough to buy a 950.
With IF DSP, you can eliminate the nearby QRM in the IF stage before it gets to the AGC circuit.

I use the 920 and it has AF DSP, drives me nuts !!! I also have the 897D. I use the 897D on VHF where you normally do not get too much nearby strong signals. Of course when F2 propagation begins on 6 meters in a few years, that will change on 6 meters.

I use the 897D on 2 meter SSB and CW and it works great.

Once again, in PSK mode, you cannot tolerate nearby strong signals with AF DSP.

Subject: [FT897] Comparing the 897D with the FT-950

I operate the 897D under less than ideal conditions. Living in a New York City apartment, I must use a screwdriver antenna inside the apartment with a counterpoise hanging out the window.

Even so, I have logged 75 countries and 46 states. In other words, as imperfect the set-up is, it has worked better than I had expected.

Now I have the bug to upgrade my radio to something better. I had narrowed my choice to a Yaesu FT-950 and an Icom 7000--with the nod going to the 950.

Has anyone compared the 897 with the 950? Any thoughts on one vs. the other would be appreciated. I am looking for a rig with less noise than the 897D and with a more advanced, sophisticated set of filters and more advanced DSP.

I would keep the 897D to use on VHF-UHF. I am intrigued, for instance, by 2 meter SSB. What I am hoping for, with the 950 (or the Icom 7000) would be a quieter radio, with somewhat better selectivity and an improved ability to pull weak stations out of the noise.

I operate phone on 15, 17 and 20 meters--have dabbled with 10 and 40 meters. Also work PSK31, primarily on 20.

So,any thoughts would be appreciated. Lest you think I am deserting my 897D colleagues, I think it is one of the most amazing radios ever made.

Richard

I have seen too many times when operating RTTY where a PSK signal right next to the FSK has run the RTTY into the ground.

If Icom is better so be it.
IF DSP is the ONLY way to go.
No matter Yaesu or Icom

The narrow CW filters combined with IF shift go some way to mitigating this,
but cannot go as far as IF DSP.
ICom still have the upper hand with their twin pasdband idea - simple but
effective.

Complete Package For sale:
Yaesu FT-897D HF/VHF/UHF Rig w/ 60m and TCXO built-in,
with DC cord & manual included,
including LDG AT-897Plus Tuner (installed), (2)W4RT OPP-897 High-capacity 4500 mAh Internal batteries (installed), W4RT OFC-897 Charger for internal batteries, W4RT OPF-Y-SSB 2.3-kHz SSB filter (installed and menu-programmed). I am including a FREE RadioWavz 40m End Fed Half Wave (EFH-40) antenna and FREE SHIPPING (Continental U.S. only).

This complete package for sale for $1300 US Postal Service Money Order please.
(Regular price of all these items online would be about $1500+tax+shipping.)
Makes a great complete station for upcoming Field Day!!!

Entire contents are brand new, just purchased in Feb. 2010,
and only used a few times. Non-smoker. Reason for suddenly selling is to cover expenses of replacing my home-business laptop and camera that died. Unfortunately, business comes before pleasure, and sadly I must sell.

Please contact me at: KG4TDM @ arrl .net
Photos available upon request.

Yes, and it's amazing how many of the old timers moan about that experimentation because it uses new modes of communications such as PSK or packet, or uses the internet to extend the flexibility and functionality of radio.

Yeah, I'd sell my setup for $1300 too..... Then I could go out and buy all new for about $1450. Sounds like a plan to me....

Anybody interested?

30170. New 897D Owner, Noise Question

Yahoo group: FT897 (2010)
Date: 2010-05-26 16:21:33 UTC
From: delano1981
Topic: 30170 Message: 30170

Hello everyone,

I am the new owner of a brand new FT-897D, and let me say from the start I am just starting out in HF, so I don't have alot of experience. But I have a question about noise with this radio.

I hooked it up to my Windom dipole antenna for the first time last night and experienced very high levels of noise on 20 meters down. The level was S-8 to +10 the whole time. I checked it against my first HF transceiver, an Icom 718 hooked up to the same antenna, and the Icom noise level was fluctuating between 0 and S-5, significantly lower. Is the 897D known to be this noisy or could there be some other source of interference or something? Also, according to the manual the radio has a pre-amp mode on by default, which is disabled by turning on IPO. Should this radio be running with IPO on most of the time, or is it recommended to have IPO off as the standard operating configuration. When I turned on the pre-amp on the Icom 718 the noise levels were about the same for both radios.

Thanks
KE7LGB

You have pretty much answered the question yourself! The noise appears after you connect the antanna, so it is almost certainly just teh ambient noise floor.

Yes the pre-amp is on by default, and is certainly not needed on the lower HF bands unless you are running a very poor antenna.

Trying to compare radios by S meter reading is not a good idea. There is no standardization in S-meters (despite what you might read). The 897's meter is quite non-linear and probably the radio's worst feature.

The other factor in play is the audio bandwidth which is quite high unless you set up and turn on the DSP filter, so the 897's audio can sound digfferent to some other radios in a side by side comparison.

The real test is to listen to a bearly decernable signal on one radio and then on the other to see what the noise floor actually is. Ignore S meter comparisons.

Wow, the exchange rate sure makes a difference then! I was looking at it thinking it looked like a pretty good price.. Just the radio is $1499 here.. - tuner is ~$300.. batteries (from china, not proper yaesu) are $200 a pop! Although with the way the aussie dollar has taken a nosedive in the last month or two, it'd probably be about even now..

I just purchased an 897D and when I got it out of the box I noticed that the VHF\UHF antenna connection is not a standard PL259. I checked the manual and it says it is a PL259 but the internals look different then the PL259 antenna input for the HF antenna. Thanks for the assistance.

I believe the European models have an N connector for VHF/UHF instead of PL259.

Does it look like this: http://en.wikipedia.org/wiki/N_connector

On mine it's a N-type, so yours is probably the same. PL259 for HF and 50Mz, N-type for VHF/UHF.

Hope this helps.

It's a N plug. Take care a PL259 could be screwed in with some effort BUT it might damage the N socket with as consequence some repairs to perform, possibly the replacement of the socket.

Hi Scott,

In the US they are supplied with the SO239 connector. The rest of the world are supplied with the much superior N connector.

This applies to most Yaesu rigs.

I use a Carolina Windom 80 Short on my 897 and it does good. I initally could only get it up about 30' and it was pretty noisy. I managed to get it up to 50' and the noise situation improved. At 30' I was getting a lot of electrical noise from my own house.

With this antenna nd 100 watts, I have managed contact all over the world, even with the solar cycle low.

30181. Re: LDG AT-897 versus the 'plus'

Yahoo group: FT897 (2010)
Date: 2010-05-28 00:10:24 UTC
From: kb7wsd
Topic: 30062 Message: 30181

Well, I now have some answers and I thought I'd post them here for those folks that come looking here for the answers to the same question.

The differences between the 'original' and 'plus' versions of the AT-897 are as follows: 200 memories increased to 2000, elimination of the Y-ACC cable as a result of changing the programming so that all control takes place over the CAT cable, 'power reduction' during tune (to 10W), 'rough' SWR indication via flashing LED and feedback of tuner operation via LED, additional modes of operation via button press sequences.

I have been exchanging emails with someone at LDG (I don't know who since they weren't signing the emails) and I am disappointed. I asked some specific questions and never got specific answers. At one point the writer suggested that the only difference was that the accessory `Y-cable' had been eliminated and all commands were sent through the CAT cable.

Pretty much the constant answer was that I should send the tuner in if it wasn't working correctly (a claim I never made in any way, shape or form) and that it was tough luck (not their actual words, but certainly their attitude) that I bought the AT-897 just weeks before the Plus was released.

I was surprised by all this since everyone seems to speak well of LDG products and in my mind that tends to mean that there is good customer service. I would not describe my experiences as resulting in me being satisfied by the AT-897 or LDG.

I'm frustrated by all this since I just bought a IC-7000 for the truck and was going to look for a tuner for when I might operate portable with the 7000 too (though with the built in power supply and battery kluge, I still use the 897 for my portable ops, exp. on 6M.) I don't have any comfort with LDG any more so I'm now looking for suggestions for a replacement tuner for the 897 that provides more user feedback (and perhaps true one touch tuning, and maybe even real autotuning.) I suspect I will ultimately sell the AT-897 as well.

30185. Fixing FT-897 that had gone deaf on 6 meters

Yahoo group: FT897 (2010)
Date: 2010-05-27 23:31:05 UTC
From: thepalmhq
Topic: 30185 Message: 30185

I'm posting this for documentation of a problem that several hams have had with their FT-897s (and one on an FT-857). The 6 meter front-end transistor can be blown, leaving the rig almost deaf on 6 meters. Here's the info on fixing the problem:

http://g-eight-ubj.blogspot.com/2010/03/6m-band-pass-filter.html

http://w9hq.blogspot.com/2010/05/ft-897d-deaf-on-6-meters-no-more.html

I hope this can be helpful to anybody who has the same problem with the 6 meter front-end on their FT-857/897.

> can't seem to find it !

Don't feel bad, it's a tough manual.

Menu item 75 is the power level. Prolly not it.

Menu item 80 determines what the little knob ring to the right of the VFO
knob does. Maybe but I doubt you'd over look that.

Let me ask if you've tried to set up a repeater yet. If you have, maybe,
maybe, you have the tone squelch on receive - on. That will only open the
squelch when it hears a tone. Review the section on repeater operation and
see if you have it on. It shows an icon on the screen if so.

It starts on page 24 and is controlled by menu screen 'D'

Let us know if that fixes things.

DE N7UVL,
APRS is just a form of packet (digital). Any TNC can work.
Perhaps you could elaborate on what you need?/ga

The Kenwood RC-D710 is a standalone 1200/9600 bps TNC with APRS firmware which includes Smartbeaconing (tm) technology. It can replace the faceplate of a Kenwood TM-V71A dualband mobile radio as well and upgrade it to operate the same as a TM-D710A. You can plug in an AVMAP G5 ($499.95 at HRO) or..... you could just plug in a cheap handheld GPS like the Garmin eTrex (about $100 at Walmart, Target, etc). I am personally using a Yaesu VX-8DR (R and GR will work as well). You would need to buy the optional GPS unit and it's connector to make it work. The VX8-GR has only two bands and has built-in GPS and is cheaper than the other two. With the VX-8 series, you wouldn't have to tie up the FT-897D on 2 meters and be able to operate as normal. Check out my latest tracks on www.aprs.fi . I'm using the VX8-DR with a Diamond HT antenna INSIDE my truck with the GPS plugged into the hand mic which is hanging from the handle above the
glovebox.

Ham Radio Deluxe has a program built in that does Satelite tracking and as a added bonus, it will do the offset for you automaticly as the satelite passes over your location. I have played with it a little, so not an expert on it, but it seams to work ok. Of coarse you need a computer and a Cat cable for it to work.

Hi Scott,

In the US they are supplied with the SO239 connector. The rest of the world
are supplied with the much superior N connector.

This applies to most Yaesu rigs.

I just purchased an 897D and when I got it out of the box I noticed that the
VHF\UHF antenna connection is not a standard PL259. I checked the manual
and it says it is a PL259 but the internals look different then the PL259
antenna input for the HF antenna. Thanks for the assistance.

30198. question about the LDG Z-11 Pro II

Yahoo group: FT897 (2010)
Date: 2010-05-28 18:56:03 UTC
From: David Ross
Topic: 30198 Message: 30198

Does this LDG tuner work well with the FT-857D?

Will the tuner handle 100 Watts of RF on a continuous basis?

The Z-11 Pro II seems like a bargain compared to SGC tuners, and I am wondering why it is so much less expensive than it's competition.

73, thanks
Dave Ross N7EPI

30199. VFO knob fell off

Hi guys,
Yesterday I went to go to work and as I was going down the driveway which is up and down hill the vfo knob just fell off, has anyone else experienced this ? if so how do I get it back on ???? I cannot see any set screws like the older rigs only a spring that was on the shaft with a plastic washer inside the spring.
thanks in advance.

If the 897 knob is the same as the 857 knob you peel the rubberback and there is a set screw that uses an allan wrench to tighten it. Becareful though so you don□t over tighten it and strip the brass threadsof the know.

I too have the Z11 pro (not to the II though). It works well for me, the only drawback I have seen, which is documented, is that if you have the tuner set to auto tune and transmit VHF/UHF some will leak through to the tuner and it will attempt to tune forever. I followed the advice on w4rt's page and just disabled the auto tune feature (which saves my batteries anyway). I particularly liked this because I can run around with it on battery power and should the need arise use a barbed wire fence as a long wire antenna with no power in sight :)

Subject: [FT897] New 897D Owner, Noise Question

Hello everyone,

I am the new owner of a brand new FT-897D, and let me say from the start I am just starting out in HF, so I don't have alot of experience. But I have a question about noise with this radio.

I hooked it up to my Windom dipole antenna for the first time last night and experienced very high levels of noise on 20 meters down. The level was S-8 to +10 the whole time. I checked it against my first HF transceiver, an Icom 718 hooked up to the same antenna, and the Icom noise level was fluctuating between 0 and S-5, significantly lower. Is the 897D known to be this noisy or could there be some other source of interference or something? Also, according to the manual the radio has a pre-amp mode on by default, which is disabled by turning on IPO. Should this radio be running with IPO on most of the time, or is it recommended to have IPO off as the standard operating configuration. When I turned on the pre-amp on the Icom 718 the noise levels were about the same for both radios.

Thanks
KE7LGB

"Collins" is a good name, but I don't know who is making the filters today.

"INRAD" makes a really fine filter. I am using their filters in both of my FT-857D rigs. The 500 Hz filters are excellent, have great "skirts" and are "10-Pole" units.

The Yaesu filters are good, but not as sharp as the INRADS.

I have a Z11-Pro and have been pleased so far. I've only used it at low power.

I'd read somewhere that the ratings were PEP, not continuous power. To be fair the 897's 100W is also PEP. Running a continuous mode such as AM or a data mode will need reduced power.

Hi Sean, Jay and Group

The filters that you are looking for are very expensive.

Can I suggest a alternative. I am the moderator of the MDSRadio Yahoo group and we have been developing a demodulation and DSP software (runs on a Windows PC) with hardware system that takes the 455kHz IF from the option port and converts it down to 12kHz which plugs into the soundcard. From there all the demodulation and the filtering is done in software. The down converter works for DRM as well. The resulting audio is astoundingly clean!
The whole project is a non profit development developed by amateur radio operators. We also have a kit available for cost and we ship worldwide.

Please check out the website: http://users.skynet.be/myspace/mdsr

All the best;

Alex

I use soundmodem which is a software based tool that uses a
laptop/desktop soundcard as a TNC. I use this for APRS and it works
well. I have integrated this with Xastir (linux based APRS software)
which is a highly straight forward solution. This is a larger set up
than some want, they want an integrated device, but for my needs with
the 897 it works well. For portable I use the VX8 and it all seems to
work, the two can communicate with each other.

Invite your attention to SPRAT Issue 142, article on JOTA 40 Super Het RX.

SPRAT is a print pubication of gqrp group,
http://www.gqrp.com <http://www.gqrp.com/>

Kits are available. All parts, PCB, VFO assembled & tested. Likely pricing is USD 35 a piece + shipping

Fully assembled & tested unit is USD 55/- + shipping.

Needs 12 VDC to work. Power supply not included.

Photos are at
http://jota40rxmonodualbandtxtrx.grouply.com/photos/album/attachments

writeup is at: http://jota40rxmonodualbandtxtrx.grouply.com/files

.
Also mono-band & dual-band TRx are in the oven being cooked :) Of course, TRx is to be sold ONLY to licensed Hams.
.
These are soon to be made available as finished products, tested & aligned.
.

Group buyers welcome!

I currently have the VX-170, but plan on adding the VX-8GR in the future. I like the VX-8 series, but really like the built-in GPS of the new VX-8GR.

I have one of the original vx8rs with the gps unit that attaches to the top of the radio. It makes it a little more bulky (it may not fit in all pouches) but its solid and works well for me.

Thanks Bret, you gave me something else to look into; I wasn't aware of Xastir. I am a big Linux fan and have been using it for years. At home I am currently building a VMWare server, and will be building a Debian VM.

I have the Rigblaster USB PnP audio interface that I am using with my 897. I am not sure if I can get that interface running on Linux which is why I have been looking into TNCs. Back in the Late 80's I had the AEA PK-232MBX, and it couldn't have been easier to use.

I use a kpc-3 plus because it is sand alone after the computer is off.
but most hams are using the sound card interfaces like the rig blaster, because it does all digital modes, in a box.
they make tnc's old tech.

30226. FT-897D and Ameritron ALS-600 amplifier

Yahoo group: FT897 (2010)
Date: 2010-05-31 16:33:34 UTC
From: wlathan2005
Topic: 30226 Message: 30226

Does anyone have a setup like that above? If so, I'd appreciate knowing how you have connected the cables. The amplifier will work with no ALC connection simply using a cable I bought off eBay going from the CAT connector on the 897 to the relay socket on the amp. I also have a cable from Yaesu that connects the ACC socket on the radio to the ALC socket on the amp. However, with that connected, I'm unable to tune the ALC correctly per the amplifier directions. Any help would be appreciated.

TIA,

Bill, AK5K

First, in my experience the 897D is noiser than my old Kenwood TS440 and not a surprise it is noiser than the ICOM. Second, run the IPO, or pre-amp, off below 20 meters. Also, keep in mind that the noise characteristics of the HF bands vary with season and time of day. I program the various WWV - NIST Time Standard frequencies into memory and then run through them like a poor man's beacon to get a feel for propagation in the HF bands before attempting contacts.

Subject: [FT897] PC software for auto scan & log

Hello, I saw many softwares for various scanners with ability for auto-scan/save log./ freq./time/MP3 audio/skip known frequencies, etc., but in 2007(when i did a research) I did not found any software who support FT-857/FT-897. Is there any SW for that now ? I have CAT/Audio interface and it will be great to hear every evening resume of the activity during the day when i am at work. I can buy MP3 player with VOX activated recording and radio left in scan mode, but how to log QRG for each file ?

Thanks & 73 de LZ2STO

Hi all,

I finally got around to assembling the Mic/Cat cable project per Fil's instructions below. Unfortunately it did not work, my guess is because the tuner is an MFJ-929 and not an FC-30.

I'll keep the MFJ-929 tuner, it is an excellent unit. Minor inconvenience, is changing the bands and
modes manually. Thanks for the input from all.

Hi Fil,

Downloaded the English version of your Mic/Cat project, seems easy enough to

Build.

Could not locate the 8 pin female mini din at Radio Shack or Micro center.

Ordered the parts from www.mouser.com, will be getting all parts within a week.

Best regards,

DE N7UVL,
More info on the SM-6 would be helpful. The 897 modular jack on the front with 8 pins, provides +5VDC on pin 6. The available info on the SM-6 indicates it also is an 8 Pin modular. In addition the SM-6 info indicates its not compatible with non-Icom radios. I'm not sure I believe that. We hams can make a lot of things work beyond their original design. The 8 pin modular jack pin-out on the 897 can be found in the manual./ga

From: Michael Hughey
Topic: 30230 Message: 30236

One time my FT-897D had a power flicker and it slipped into Emergency mode and I could not change modes or frequencies. I too did a reset, but when it did it again, I reviewed all of the defaults on every menu and discovered that it slipped into Emergency mode, which changes the radio to the Alaska Emergency Frequency. I shut it off (in the menu) and the radio became normal again.

    My only problem now is that the factory preset on FM squelch is gone. Sometimes I can get it back, but marginally. I've changed Menu 80 to RF Gain and if I adjust the RF Gain just right, it will work, but not like it did out of the box.

30239. Need help with Antenna selection

Yahoo group: FT897 (2010)
Date: 2010-05-31 23:47:28 UTC
From: ice_berg_
Topic: 30239 Message: 30239

I just passed the general test, and will be buying an 897D setup in the next week or two (waiting on a contract check). Where I live I can not have a tower so I was looking at something like a buddipole but I thought I would ask around and see what types of input I could get. Whatever it is it has to be able to be taken down when not in use or when the owner of the property requests (ie maintenance on the property etc, they just don't want a semi/permeant feature)

The setup I will be purchasing is the 897D, the LDG 200 memory auto tuner, FP-30 for base station use.

Comments are very welcome but mostly Im looking for what I can do about the antenna situation, there isn't room here to erect a 1/2 wave dipole for most of the HF bands.

30240. Re: [FT897] Need help with Antenna selection

Before you lay down your money for the tuner, take a look at the LDG AT-100 Pro II. I have had one since they were released in March. I am very happy with it.

Also, I use a G5RV variant and have had quite good luck with it. If you put it u[with pulleys, it may satisfy your landlord's requirements.

Where I live I can not have a tower so I was looking at something like a buddipole but I thought I would ask around and see what types of input I could get. Whatever it is it has to be able to be taken down when not in use or when the owner of the property requests (ie maintenance on the property etc, they just don't want a semi/permeant feature)

The setup I will be purchasing is the 897D, the LDG 200 memory auto tuner, FP-30 for base station use.

Comments are very welcome but mostly Im looking for what I can do about the antenna situation, there isn't room here to erect a 1/2 wave dipole for most of the HF bands.

You just might want to consider a Par Electronics Endfedz antenna. They make them in several different bands. Some of the shorter antennas, 17, 15, 10 meters could easily be stretched across a short room or hung over a balcony, inverted L style and work just fine. Take a look at the Eham reviews under Wire Antennas.

I also use the AT 200 pro and it works great.

Good Luck
Chuck

Ray,

I have a SM-5 wired for my FT-897D. However, I had to modify the microphone to work with it though. I believe the SM-5 is just an older version of the SM-6. They look alike. Two things are a problem:

1. The SM-5 requires DC voltage on the mic audio line. The FT-897D breaks these out to two different lines.
2. The SM-5's audio gain is WAY too high for the FT-897D

I had to decouple the mic audio line with a capacitor. Supply the DC via a resistor to the SM-5's mic line in front of the capacitor. Last but definitely not least, I had to build a resistor PI network attenuator to lower the audio by 20 or 40 dB (can't remember now). When I get home I'll try to find my schematic that I drew up and up load it to the group.

Ray,

Looking at the SM-6 schematic it may be easy to just cut a trace (from R5 to C4) to reroute the DC power and add a small resistive attenuator (3 resistors) in the audio line.

From: W1AEX
Topic: 30230 Message: 30246

Hi Graham,

The "locked" mode and band keys phenomenon will happen if the rig is turned on in the transmit mode. This happened to me a number of times after I pulled the rig forward from its normal position on the operating desk, causing the cw plug to pull partially out of the cw jack on the back panel. The partially inserted plug closed the keying circuit so that when the rig was powered on, it detected the fault and came up in "safety mode" which prevents inadvertently powering the rig up in the transmit mode. The same thing would happen when my wife would throw my mail onto the operating desk on top of the CW key.

I don't think this "feature" is documented in the manual, but it has been brought up here several times over the years. Your description sounds similar to what others have experienced with this feature.

30247. FT-897D Backlighting/Illumination of keys?

Yahoo group: FT897 (2010)
Date: 2010-06-01 13:59:18 UTC
From: Philip
Topic: 30247 Message: 30247

Hi. I have an FT-897D I bought last week and am loving it with the LDG AT-200 and a G5RV. Anyway...my questions is whether or not the keys outside of the screen should be illuminating? I am operating with the internal power supply from AC and am aware of the various settings for the LCD and its illumination modes, but do other keys not have any back-lighting to help you see them in the field or mobile?

For example the V/M, HOME, DSP, BAND UP and BAND DOWN buttons? Hoping my rig doesn't have a problem....may be they just don;t have any lighting? I don;t see any setting and I have searched the FT-897D operating manual in PDF form with searches for 'illuminat' and 'light' and 'key' etc.

Thanks.

From: iz0inx
Topic: 30229 Message: 30250

Hi Noel,

I have the MFJ-993b, which is a slightly different version of the MFJ-929 and I agree with you, it's definitely an excellent tuner.

I believe that the reason why it didn't work is that you miss to use the MFJ-5114Y interface. As stated on pag.10 of the manual (http://www.mfjenterprises.com/man/pdf/MFJ-929.pdf) it is needed for interfacing the tuner with the FT-897.
With that interface the rig will see the tuner as it were a FC-30.

If I'm wrong and you have the MFJ-5114Y, you have to consider that my Mic/CAT interface makes available only the CAT functionality, not all the signals available on the CAT connector on the rear panel of the 897.
So, what you have to do, is to use the CAT from the mike connector only for communicating with a program (i.e. Ham Radio Deluxe) whereas the rear socket is the right place to connect the MFJ-5114Y and then your tuner.

By the way, when I went to similar trouble, I decided that the MFJ-5114Y was too expensive to buy and decided to build something by myself.
I actually don't like to activate the tuning by pressing the Tune button on the rig, as I want to have other menus available then the MF-k.
I prefer to press the TUNE button on the tuner. In order to have it working I realized a simple interface which basically force the 897 to go in TX with a carrier when the button is pressed.
It is connected to the ACC socket on the 897 and is quite simple and cheap to realize.
If you like, I can send you the schematics.

Hope this helps,
cheers,
Fil IZ0INX

Well I do not have, much space, but i do have is a carport, covered with corrugated aluminum. I mounted the S9 vertical, in the middle of the roof. I grounded it to the roof. I have about 25-30 feet all around, working as a counter-poise. As for the performance......it's incredible. Best antenna I ever had installed, next to my Cushcraft A3S tribander. Iv'e been able to work alot of DX with it. Just my 2 cents.

Joe,

One of my friends has a buddy pole antenna and we simply have not had a good experience/s with it. It probably meets all of its published specifications. However, for the money invested, he probably could put up a more electrically efficient and less expensive antenna. That is all that was meant by my comment. (Possibly, he is in such a restricted area, the buddy pole antenna might be his only solution.)

From: Bret McDanel
Topic: 30239 Message: 30253

I think the first thing that has to be established are what bands do you plan on working on. The more bands you want quite often the more compromises you have to make in performance. The more portable it is the more compromises you have to make. Remember that the radiating element is only half the antenna, you need a counterpoise for the RF to "push off" of.

Also remember that the closer to the ground the more it will be NVIS and the higher up the more DX it will be. The general rule of thumb that I have heard is typically at 1/4 wavelength is the threshold to go from NVIS to DX, so if you want 20 meters you have to be at least 5 meters off the ground to go from NVIS to DX. There are other factors that come into play, but that is the general starting point.

The other thing to consider is the larger the antenna the better it will work (to a point). Antennas that are more compact generally do not work as well as antennas that are "full size".

There is the ATAS-120 which is an auto tuning antenna. I have mounted one on a tripod and made radials for it. I spread them out and it makes for a portable setup. It even stores away in a small package when not in use. This is not ideal but it is better than the manual "portable" ATAS antenna.

The radials attach to a metal plate via wingnuts. Someone else did something similar and they have photos at http://www.ae7q.net/doc/public/ATAS-120.php

The downside is that the ATAS-120 will only do a few bands, there is another brand of auto tuning antenna that does more (which I only found out about after getting the ATAS).

You can do a long wire with a tuner, but again performance is not as optimal as a properly tuned antenna. I have used a Z11 pro from LDG and a balun with good results. You could use a dipole with this, even something like a "lazy-h" tuned for some band that will lend itself to reasonable performance on other bands. People have run 200w on a fairly small gauge of wire, although if you really want to do this right you might want to use copperweld or similar (copper jacketed steel wire) to prevent stretching which changes the SWR over time. If the wind can whip the antenna around you may notice some problems making contact with weak stations so having the antenna secured taught might be a good design consideration.

Wire antennas like that are often easy to hide, which means almost no one asks you to take it down because they just dont associate a small wire wrapped around the eaves of the house as an antenna, especially if

it blends in well in terms of color. YMMV.

I got the dtmf mic for the 897 and its keys are backlight and you can do almost everything with that instead of doing it with the controls on the radio. It does take a little learning to know what buttons do what without thinking about it, but it is something you can do if you really want night/low-light backlit options.

Bret:

Minor point of clarification for some who may not be aware. The above statement really only applies to horizontal antennas. Vertical antennas typically favor a low angle even if they are ground mounted and will not favor NVIS regardless of how high or low they are.

Perhaps the other point is that this is all kind of a continuum. There is no real cut-off point above or below which you do or don't have NVIS. As such, you can at times work DX well on a low antenna even though it may be some 10 or 20 dB down at lower angles and similarly you can at times work NVIS on high antennas.

Also, if anyone's not familiar with NVIS, you might want to take a few minutes to search around the Internet for info. Here's one link below. NVIS is not particularly intuitive to people who typically work DX on higher antennas, verticals, or beams, so it's worth reading up on it.

There is a learning curve to the Buddipole. It's not tough, but some folks have trouble until the 'figure it out.' There is a Buddipole group you can join for advice, or I will be happy to answer questions off this list. The Buddipole is one of the best portable antenna systems around.

Hi, group. I forgot to mention the Buddipole. I have one of those as well, and use it when we go to the beach. It is perfect for a balcony situation. However, if you have the room, the Par Electronics just works better.

Thanks for the replies. Sort of relieved that there's no problem with my rig, it just lacks the button back-lighting as a feature. OK.

I did get the lighted DTMF mic with it, but no matter how I set the two switches on the mic, I still don't seem able to QSY the rig with it nor enter freqs etc. I imagine there must be some menu item for that huh?

Thanks,

Phil

30260. FT-897D Settings For Olivia, Domino, MT63

Yahoo group: FT897 (2010)
Date: 2010-06-02 00:29:05 UTC
From: JonP
Topic: 30260 Message: 30260

I have been very successful in using my FT-897D on PSK (various) and RTTY (various). However, I have been entirely unsuccessful on Olivia, Domino, MT63.

I use a SignaLink USB interface and DM780 with the FT-897D in the digital mode. For PSK I use the PSK-U digital setting, and for RTTY I use the RTTY-U setting. For Olivia, etc. I've tried the PSK-U mode as well as the USER-U mode.

I'm seeing the signals on the waterfall, but no matter what I do they're just not translating to text. Sometimes they'll translate to gibberish, but that's as close as I've come.

Can anyone suggest setting changes that I need to make on the radio please? If I use digital mode USER-U, are there setting changes on menu items 36 and 38 that I need to make? Or on anything else? NB, AGC, DSP?

Thanks in advance

Jon

Yes, for using the MH-59 mic you have to set the menu 059 to "RMT" whereas with normal mic just leave it on "NOR".

We have a Par Endfedz 6 metre antenna; signals are coming in (and out) but weak, with a lot of noise on FM.
Good friend has some for other bands as well and those seem to work fine.

You just might want to consider a Par Electronics Endfedz antenna. They make them in several different bands. Some of the shorter antennas, 17, 15, 10 meters could easily be stretched across a short room or hung over a balcony, inverted L style and work just fine. Take a look at the Eham reviews under Wire Antennas.

I also use the AT 200 pro and it works great.

Good Luck

I use PSK-U setting and Signalink, no problem using Olivia and MT63 using FLDIGI programme. Don't use any filtering but must have ALC turned on and then managed using Signalink where it barely goes on and then back it off.
Jon, feel free to contact me personally, I might be of more help when I am actually at the shack...

From: Brian Forney
Topic: 30239 Message: 30264

I live in a CCR area so I've had to make some antenna compromises. It's a bit spendy but just so you have another option you might want to check out vertical dipoles (no ground radials needed) from either Force 12 or Trans World. They are only 9' or so tall and work sitting on the ground.

I have the Trans World Antenna "Backpacker" and have been quite happy with it. It comes with a stand and is very easy to put up/tear down. My local geography is not great for HF (I live in a hollow-everything nearby is uphill from me) but it lets me make plenty of domestic contacts as well as some international. Taken out in the field and set up in the clear on high ground it really shines.

As someone else said, be sure to consider what band(s) you want before purchasing. The multi-band vertical dipoles tend to be 5 band 10-20m units. As a final note, perhaps you could borrow some portable antennas from someone in your local club. This way you could get a feel for what a buddipole set up or some of the other options would do from the spot you have to work with. It's good to get as much of the trial and error as you can completed before you start to spend real money.

My main issue with where I currently am is that it was hard enough getting them to agree to the grounding rod. I have considered trying to get them to allow a flag pole and try a flag pole antenna.

Like I mentioned I just passed the test so I I have my CSCE but the FCC db hasn't even been updated yet. So my experiences with HF are minimal. We have a ham group here but most of them have not had to deal with the restrictions I do, so their advice was minimal.

At this point I do not know what bands I will want to work. Right now I just have to look for a system that can be taken down at the end of the day with no trace that it was ever there. If there is a good way to set up a vertical without having to pour concrete or pounding a post into the ground where I can take the antenna down and inside at the end of the session that would be great. If I can also get something to do a few bands to experiment with that would also be great.

Hi Bryan,

Take a look here:

http://transworldantennas.com/

I don't have one yet, but many people seem to think very highly of this antenna. Since it folds up into a small package, does not use ground rods or radials, and isn't too large it might be a solution to your problem. Take a look at the e-ham reviews of it too.
